[7654] VGAM550 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA virus 2–1. VGAM550 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7655] VGAM550 gene, herein designated VGAM GENE, encodes a VGAM550 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM550 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM550 precursor RNA is designated SEQ ID:536, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:536 is located at position 4755 relative to the genome of Leishmania RNA virus 2–1.

[7656] VGAM550 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM550 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7657] An enzyme complex designated DICER COMPLEX, dices the VGAM550 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM550 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM550 RNA is designated SEQ ID:3261, and is provided hereinbelow with reference to the sequence listing part.

[7658] VGAM550 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM550 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM550 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7659] VGAM550 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM550 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM550 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM550 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM550 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7660] The complementary binding of VGAM550 RNA, herein designated VGAM RNA, to host target binding sites on VGAM550 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM550 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM550 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7661] It is appreciated that VGAM550 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM550 host target genes. The mRNA of each one of this plurality of VGAM550 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM550 RNA, herein designated VGAM RNA, and which when bound by VGAM550 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM550 host target proteins.

[7662] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM550 gene, herein designated VGAM GENE, on one or more VGAM550 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7663] It is yet further appreciated that a function of VGAM550 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM550 include diagnosis, prevention and treatment of viral infection by Leishmania RNA virus 2-1. Specific functions, and accordingly utilities, of VGAM550 correlate with, and may be deduced from, the identity of the host target genes which VGAM550 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[7664] Nucleotide sequences of the VGAM550 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM550 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM550 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM550 are further described hereinbelow with reference to Table 1.

[7665] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM550 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7666] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 551 (VGAM551) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7667] VGAM551 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM551 was detected is described hereinabove with reference to Figs. 2–8.

[7668] VGAM551 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leishmania RNA virus 2–1. VGAM551 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7669] VGAM551 gene, herein designated VGAM GENE, encodes a VGAM551 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM551 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM551 precursor RNA is designated SEQ ID:537, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:537 is located at position 3584 relative to the genome of Leishmania RNA virus 2–1.

[7670] VGAM551 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM551 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7671] An enzyme complex designated DICER COMPLEX, dices the VGAM551 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM551 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM551 RNA is designated SEQ ID:3262, and is provided hereinbelow with reference to the sequence listing part.

[7672] VGAM551 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM551 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM551 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7673] VGAM551 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM551 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM551 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM551 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM551 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7674] The complementary binding of VGAM551 RNA, herein designated VGAM RNA, to host target binding sites on VGAM551 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM551 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM551 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7675] It is appreciated that VGAM551 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM551 host target genes. The mRNA of each one of this plurality of VGAM551 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM551 RNA, herein designated VGAM RNA, and which when bound by VGAM551 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM551 host target proteins.

[7676] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM551 gene, herein designated VGAM GENE, on one or more VGAM551 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7677] It is yet further appreciated that a function of VGAM551 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM551 include diagnosis, prevention and treatment of viral infection by Leishmania RNA virus 2-1. Specific functions, and accordingly utilities, of VGAM551 correlate with, and may be deduced from, the identity of

the host target genes which VGAM551 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7678] Nucleotide sequences of the VGAM551 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM551 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM551 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM551 are further described hereinbelow with reference to Table 1.

[7679] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM551 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7680] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 552 (VGAM552) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7681] VGAM552 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM552 was detected is described hereinabove with reference to Figs. 2–8.

[7682] VGAM552 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus D. VGAM552 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7683] VGAM552 gene, herein designated VGAM GENE, encodes a VGAM552 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM552 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM552 precursor RNA is designated SEQ ID:538, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:538 is located at position 980 relative to the genome of Human adenovirus D.

[7684] VGAM552 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM552 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7685] An enzyme complex designated DICER COMPLEX, dices the VGAM552 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM552 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM552 RNA is designated SEQ ID:3263, and is provided hereinbelow with reference to the sequence listing part.

[7686] VGAM552 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM552 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM552 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7687] VGAM552 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM552 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM552 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM552 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM552 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7688] The complementary binding of VGAM552 RNA, herein designated VGAM RNA, to host target binding sites on VGAM552 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM552 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM552 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7689] It is appreciated that VGAM552 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM552 host target genes. The mRNA of each one of this plurality of VGAM552 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM552 RNA, herein designated VGAM RNA, and which when bound by VGAM552 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM552 host target proteins.

[7690] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM552 gene, herein designated VGAM GENE, on one or more VGAM552 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7691] It is yet further appreciated that a function of VGAM552 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM552 include diagnosis, prevention and treatment of viral infection by Human adenovirus D. Specific functions, and accordingly utilities, of VGAM552 cor-

relate with, and may be deduced from, the identity of the host target genes which VGAM552 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7692] Nucleotide sequences of the VGAM552 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM552 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM552 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM552 are further described hereinbelow with reference to Table 1.

[7693] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM552 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7694] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 553 (VGAM553) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[7695] VGAM553 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM553 was detected is described hereinabove with reference to Figs. 2–8.

[7696] VGAM553 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine parainfluenza virus 3. VGAM553 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7697] VGAM553 gene, herein designated VGAM GENE, encodes a VGAM553 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM553 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM553 precursor RNA is designated SEQ ID:539, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:539 is located at position 7376 relative to the genome of Bovine parainfluenza virus 3.

[7698] VGAM553 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM553 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7699] An enzyme complex designated DICER COMPLEX, dices the VGAM553 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM553 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM553 RNA is designated SEQ ID:3264, and is provided hereinbelow with reference to the sequence listing part.

[7700] VGAM553 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM553 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM553 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7701] VGAM553 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM553 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM553 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM553 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM553 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7702] The complementary binding of VGAM553 RNA, herein designated VGAM RNA, to host target binding sites on VGAM553 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM553 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM553 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7703] It is appreciated that VGAM553 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM553 host target genes. The mRNA of each one of this plurality of VGAM553 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM553 RNA, herein designated VGAM RNA, and which when bound by VGAM553 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM553 host target proteins.

[7704] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM553 gene, herein designated VGAM GENE, on one or more VGAM553 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7705] It is yet further appreciated that a function of VGAM553 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM553 include diagnosis, prevention and treatment of viral infection by Bovine parainfluenza virus

3. Specific functions, and accordingly utilities, of VGAM553 correlate with, and may be deduced from, the identity of the host target genes which VGAM553 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7706] Nucleotide sequences of the VGAM553 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM553 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM553 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM553 are further described hereinbelow with reference to Table 1.

[7707] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM553 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7708] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 554 (VGAM554) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[7709] VGAM554 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM554 was detected is described hereinabove with reference to Figs. 2–8.

[7710] VGAM554 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Spodoptera exigua* nucleopolyhedrovirus. VGAM554 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7711] VGAM554 gene, herein designated VGAM GENE, encodes a VGAM554 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM554 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM554 precursor RNA is designated SEQ ID:540, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:540 is located at position 47344 relative to the genome of *Spodoptera exigua* nucleopolyhedrovirus.

[7712] VGAM554 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM554 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7713] An enzyme complex designated DICER COMPLEX, dices the VGAM554 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM554 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM554 RNA is designated SEQ ID:3265, and is provided hereinbelow with reference to the sequence listing part.

[7714] VGAM554 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM554 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM554 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7715] VGAM554 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM554 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM554 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM554 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM554 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7716] The complementary binding of VGAM554 RNA, herein designated VGAM RNA, to host target binding sites on VGAM554 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM554 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM554 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7717] It is appreciated that VGAM554 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM554 host target genes. The mRNA of each one of this plurality of VGAM554 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM554 RNA, herein designated VGAM RNA, and which when bound by VGAM554 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM554 host target proteins.

[7718] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM554 gene, herein designated VGAM GENE, on one or more VGAM554 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7719] It is yet further appreciated that a function of VGAM554 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM554 include diagnosis, prevention and

treatment of viral infection by *Spodoptera exigua* nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM554 correlate with, and may be deduced from, the identity of the host target genes which VGAM554 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7720] Nucleotide sequences of the VGAM554 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM554 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM554 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM554 are further described hereinbelow with reference to Table 1.

[7721] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM554 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7722] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 555 (VGAM555) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7723] VGAM555 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM555 was detected is described hereinabove with reference to Figs. 2–8.

[7724] VGAM555 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Spodoptera exigua* nucleopolyhedrovirus. VGAM555 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7725] VGAM555 gene, herein designated VGAM GENE, encodes a VGAM555 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM555 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM555 precursor RNA is designated SEQ ID:541, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:541 is located at position 47117 relative to the genome of *Spodoptera exigua* nucleopolyhedrovirus.

[7726] VGAM555 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM555 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7727] An enzyme complex designated DICER COMPLEX, dices the VGAM555 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM555 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM555 RNA is designated SEQ ID:3266, and is provided hereinbelow with reference to the sequence listing part.

[7728] VGAM555 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM555 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM555 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7729] VGAM555 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM555 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM555 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM555 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM555 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7730] The complementary binding of VGAM555 RNA, herein designated VGAM RNA, to host target binding sites on VGAM555 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM555 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM555 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7731] It is appreciated that VGAM555 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM555 host target genes. The mRNA of each one of this plurality of VGAM555 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM555 RNA, herein designated VGAM

RNA, and which when bound by VGAM555 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM555 host target proteins.

[7732] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM555 gene, herein designated VGAM GENE, on one or more VGAM555 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7733] It is yet further appreciated that a function of VGAM555 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM555 include diagnosis, prevention and treatment of viral infection by *Spodoptera exigua* nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM555 correlate with, and may be deduced from, the identity of the host target genes which VGAM555 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7734] Nucleotide sequences of the VGAM555 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM555 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM555 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM555 are further described hereinbelow with reference to Table 1.

[7735] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM555 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7736] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 556 (VGAM556) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7737] VGAM556 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM556 was detected is described hereinabove with reference to Figs. 2–8.

[7738] VGAM556 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Spodoptera exigua nucleopolyhedrovirus. VGAM556 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7739] VGAM556 gene, herein designated VGAM GENE, encodes a VGAM556 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM556 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM556 precursor RNA is designated SEQ ID:542, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:542 is located at position 47004 relative to

the genome of *Spodoptera exigua* nucleopolyhedrovirus.

[7740] VGAM556 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM556 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7741] An enzyme complex designated DICER COMPLEX, dices the VGAM556 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM556 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM556 RNA is designated SEQ ID:3267, and is provided hereinbelow with reference to the sequence listing part.

[7742] VGAM556 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM556 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM556 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[7743] VGAM556 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM556 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM556 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM556 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM556 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7744] The complementary binding of VGAM556 RNA, herein designated VGAM RNA, to host target binding sites on VGAM556 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM556 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM556 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7745] It is appreciated that VGAM556 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM556 host target genes. The mRNA of each one of this plurality of VGAM556 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM556 RNA, herein designated VGAM RNA, and which when bound by VGAM556 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM556 host target proteins.

[7746] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM556 gene, herein designated VGAM GENE, on one or more VGAM556 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7747] It is yet further appreciated that a function of VGAM556 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM556 include diagnosis, prevention and treatment of viral infection by *Spodoptera exigua* nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM556 correlate with, and may be deduced from, the identity of the host target genes which VGAM556 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7748] Nucleotide sequences of the VGAM556 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM556 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM556 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM556 are further described hereinbelow with reference to Table 1.

[7749] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM556 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7750] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 557 (VGAM557) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7751] VGAM557 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM557 was detected is described hereinabove with reference to Figs. 2–8.

[7752] VGAM557 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Spodoptera exigua nucleopolyhedrovirus. VGAM557 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7753] VGAM557 gene, herein designated VGAM GENE, encodes a VGAM557 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM557 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM557 precursor RNA is designated SEQ ID:543, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:543 is located at position 77506 relative to the genome of Spodoptera exigua nucleopolyhedrovirus.

[7754] VGAM557 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM557 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7755] An enzyme complex designated DICER COMPLEX, dices the VGAM557 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM557 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM557 RNA is designated SEQ ID:3268, and is provided hereinbelow with reference to the sequence

listing part.

[7756] VGAM557 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM557 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM557 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7757] VGAM557 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM557 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM557 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM557 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM557 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7758] The complementary binding of VGAM557 RNA, herein designated VGAM RNA, to host target binding sites on VGAM557 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM557 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM557 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7759] It is appreciated that VGAM557 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM557 host target genes. The mRNA of each one of this plurality of VGAM557 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM557 RNA, herein designated VGAM RNA, and which when bound by VGAM557 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM557 host target proteins.

[7760] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM557 gene, herein designated VGAM GENE, on one or more VGAM557 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7761] It is yet further appreciated that a function of VGAM557 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM557 include diagnosis, prevention and treatment of viral infection by *Spodoptera exigua* nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM557 correlate with, and may be deduced from, the identity of the host target genes which VGAM557 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7762] Nucleotide sequences of the VGAM557 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM557 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM557 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM557 are further described hereinbelow with reference to Table 1.

[7763] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM557 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7764] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 558 (VGAM558) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7765] VGAM558 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM558 was detected is described hereinabove with reference to Figs. 2–8.

[7766] VGAM558 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Spodoptera exigua nucleopolyhedrovirus. VGAM558 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7767] VGAM558 gene, herein designated VGAM GENE, encodes a VGAM558 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM558 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM558 precursor RNA is designated SEQ ID:544, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:544 is located at position 78942 relative to the genome of Spodoptera exigua nucleopolyhedrovirus.

[7768] VGAM558 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM558 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7769] An enzyme complex designated DICER COMPLEX, dices the VGAM558 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM558 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM558 RNA is designated SEQ ID:3269, and

is provided hereinbelow with reference to the sequence listing part.

[7770] VGAM558 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM558 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM558 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7771] VGAM558 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM558 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM558 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM558 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM558 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7772] The complementary binding of VGAM558 RNA, herein designated VGAM RNA, to host target binding sites on VGAM558 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM558 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM558 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7773] It is appreciated that VGAM558 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM558 host target genes. The mRNA of each one of this plurality of VGAM558 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM558 RNA, herein designated VGAM RNA, and which when bound by VGAM558 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM558 host target proteins.

[7774] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM558 gene, herein designated VGAM GENE, on one or more VGAM558 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7775] It is yet further appreciated that a function of VGAM558 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM558 include diagnosis, prevention and treatment of viral infection by *Spodoptera exigua* nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM558 correlate with, and may be deduced from, the identity of the host target genes which VGAM558 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7776] Nucleotide sequences of the VGAM558 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM558 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM558 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM558 are further described hereinbelow with reference to Table 1.

[7777] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM558 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7778] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 559 (VGAM559) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7779] VGAM559 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM559 was detected is described hereinabove with reference to Figs. 2–8.

[7780] VGAM559 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM559 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7781] VGAM559 gene, herein designated VGAM GENE, encodes a VGAM559 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM559 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM559 precursor RNA is

designated SEQ ID:545, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:545 is located at position 19237 relative to the genome of Fowlpox virus.

[7782] VGAM559 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM559 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7783] An enzyme complex designated DICER COMPLEX, dices the VGAM559 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM559 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide se-

quence of VGAM559 RNA is designated SEQ ID:3270, and is provided hereinbelow with reference to the sequence listing part.

[7784] VGAM559 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM559 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM559 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7785] VGAM559 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM559 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM559 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM559 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM559 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7786] The complementary binding of VGAM559 RNA, herein designated VGAM RNA, to host target binding sites on VGAM559 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM559 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM559 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7787] It is appreciated that VGAM559 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM559 host target genes. The mRNA of

each one of this plurality of VGAM559 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM559 RNA, herein designated VGAM RNA, and which when bound by VGAM559 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM559 host target proteins.

[7788] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM559 gene, herein designated VGAM GENE, on one or more VGAM559 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[7789] It is yet further appreciated that a function of VGAM559 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM559 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM559 correlate with, and may be deduced from, the identity of the host target genes which VGAM559 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7790] Nucleotide sequences of the VGAM559 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM559 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM559 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM559 are further described hereinbelow with reference to Table 1.

[7791] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM559 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[7792] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 560 (VGAM560) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7793] VGAM560 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM560 was detected is described hereinabove with reference to Figs. 2–8.

[7794] VGAM560 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM560 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7795] VGAM560 gene, herein designated VGAM GENE, encodes a VGAM560 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM560 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM560 precursor RNA is designated SEQ ID:546, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:546 is located at position 23914 relative to the genome of Fowlpox virus.

[7796] VGAM560 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM560 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7797] An enzyme complex designated DICER COMPLEX, dices the VGAM560 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM560 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 80%) nucleotide sequence of VGAM560 RNA is designated SEQ ID:3271, and is provided hereinbelow with reference to the sequence listing part.

[7798] VGAM560 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM560 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM560 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7799] VGAM560 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM560 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM560 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM560 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM560 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7800] The complementary binding of VGAM560 RNA, herein designated VGAM RNA, to host target binding sites on VGAM560 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM560 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM560 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7801] It is appreciated that VGAM560 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM560 host target genes. The mRNA of each one of this plurality of VGAM560 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM560 RNA, herein designated VGAM RNA, and which when bound by VGAM560 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM560 host target proteins.

[7802] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM560 gene, herein designated VGAM GENE, on one or more VGAM560 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[7803] It is yet further appreciated that a function of VGAM560 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM560 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM560 correlate with, and may be deduced from, the identity of the host target genes which VGAM560 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[7804] Nucleotide sequences of the VGAM560 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM560 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM560 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM560 are further described hereinbelow with reference to Table 1.

[7805] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM560 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7806] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 561 (VGAM561) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7807] VGAM561 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM561 was detected is described hereinabove with reference to Figs. 2–8.

[7808] VGAM561 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM561 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7809] VGAM561 gene, herein designated VGAM GENE, encodes a VGAM561 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM561 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM561 precursor RNA is designated SEQ ID:547, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:547 is located at position 33749 relative to the genome of Fowlpox virus.

[7810] VGAM561 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM561 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7811] An enzyme complex designated DICER COMPLEX, dices the VGAM561 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM561 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM561 RNA is designated SEQ ID:3272, and is provided hereinbelow with reference to the sequence listing part.

[7812] VGAM561 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM561 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM561 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7813] VGAM561 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM561 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM561 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM561 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM561 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7814] The complementary binding of VGAM561 RNA, herein designated VGAM RNA, to host target binding sites on VGAM561 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM561 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM561 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7815] It is appreciated that VGAM561 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM561 host target genes. The mRNA of each one of this plurality of VGAM561 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM561 RNA, herein designated VGAM RNA, and which when bound by VGAM561 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM561 host target proteins.

[7816] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM561 gene, herein designated VGAM GENE, on one or more VGAM561 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7817] It is yet further appreciated that a function of VGAM561 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM561 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM561 correlate with, and may be deduced from, the identity of the host target genes which VGAM561 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7818] Nucleotide sequences of the VGAM561 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM561 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM561 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM561 are further described hereinbelow with reference to Table 1.

[7819] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM561 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7820] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 562 (VGAM562) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7821] VGAM562 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM562 was detected is described hereinabove with reference to Figs. 2–8.

[7822] VGAM562 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM562 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7823] VGAM562 gene, herein designated VGAM GENE, encodes a VGAM562 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM562 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM562 precursor RNA is designated SEQ ID:548, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:548 is located at position 81779 relative to the genome of Fowlpox virus.

[7824] VGAM562 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM562 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7825] An enzyme complex designated DICER COMPLEX, dices the VGAM562 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM562 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM562 RNA is designated SEQ ID:3273, and is provided hereinbelow with reference to the sequence listing part.

[7826] VGAM562 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM562 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM562 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7827] VGAM562 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM562 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM562 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM562 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM562 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7828] The complementary binding of VGAM562 RNA, herein designated VGAM RNA, to host target binding sites on VGAM562 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM562 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM562 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7829] It is appreciated that VGAM562 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM562 host target genes. The mRNA of each one of this plurality of VGAM562 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM562 RNA, herein designated VGAM RNA, and which when bound by VGAM562 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM562 host target proteins.

[7830] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM562 gene, herein designated VGAM GENE, on one or more VGAM562 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7831] It is yet further appreciated that a function of VGAM562 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM562 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM562 correlate with, and may be deduced from, the identity of the host target genes which VGAM562 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7832] Nucleotide sequences of the VGAM562 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM562 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM562 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM562 are further described hereinbelow with reference to Table 1.

[7833] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM562 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7834] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 563 (VGAM563) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7835] VGAM563 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM563 was detected is described hereinabove with reference to Figs. 2–8.

[7836] VGAM563 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM563 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7837] VGAM563 gene, herein designated VGAM GENE, encodes a VGAM563 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM563 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM563 precursor RNA is designated SEQ ID:549, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:549 is located at position 82125 relative to the genome of Fowlpox virus.

[7838] VGAM563 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM563 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7839] An enzyme complex designated DICER COMPLEX, dices the VGAM563 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM563 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM563 RNA is designated SEQ ID:3274, and is provided hereinbelow with reference to the sequence listing part.

[7840] VGAM563 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM563 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM563 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7841] VGAM563 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM563 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM563 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM563 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM563 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7842] The complementary binding of VGAM563 RNA, herein designated VGAM RNA, to host target binding sites on VGAM563 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM563 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM563 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[7843] It is appreciated that VGAM563 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM563 host target genes. The mRNA of each one of this plurality of VGAM563 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM563 RNA, herein designated VGAM RNA, and which when bound by VGAM563 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM563 host target proteins.

[7844] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM563 gene, herein designated VGAM GENE, on one or more VGAM563 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7845] It is yet further appreciated that a function of VGAM563 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM563 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM563 correlate with, and may be deduced from, the identity of the host target genes which VGAM563 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7846] Nucleotide sequences of the VGAM563 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM563 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM563 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM563 are further described hereinbelow with reference to Table 1.

[7847] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM563 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7848] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 564 (VGAM564) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7849] VGAM564 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM564 was detected is described hereinabove with reference to Figs. 2-8.

[7850] VGAM564 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM564 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7851] VGAM564 gene, herein designated VGAM GENE, encodes a VGAM564 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM564 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM564 precursor RNA is designated SEQ ID:550, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:550 is located at position 81158 relative to the genome of Fowlpox virus.

[7852] VGAM564 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM564 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7853] An enzyme complex designated DICER COMPLEX, dices the VGAM564 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM564 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM564 RNA is designated SEQ ID:3275, and is provided hereinbelow with reference to the sequence listing part.

[7854] VGAM564 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM564 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM564 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7855] VGAM564 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM564 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM564 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM564 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM564 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7856] The complementary binding of VGAM564 RNA, herein designated VGAM RNA, to host target binding sites on VGAM564 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM564 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM564 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7857] It is appreciated that VGAM564 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM564 host target genes. The mRNA of each one of this plurality of VGAM564 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM564 RNA, herein designated VGAM RNA, and which when bound by VGAM564 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM564 host target proteins.

[7858] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM564 gene, herein designated VGAM GENE, on one or more VGAM564 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7859] It is yet further appreciated that a function of VGAM564 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM564 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM564 correlate with, and may be deduced from, the identity of the host target genes which VGAM564 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7860] Nucleotide sequences of the VGAM564 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM564 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM564 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM564 are further described hereinbelow with reference to Table 1.

[7861] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM564 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7862] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 565 (VGAM565) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7863] VGAM565 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM565 was detected is described hereinabove with reference to Figs. 2-8.

[7864] VGAM565 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM565 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7865] VGAM565 gene, herein designated VGAM GENE, encodes a

VGAM565 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM565 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM565 precursor RNA is designated SEQ ID:551, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:551 is located at position 104297 relative to the genome of Fowlpox virus.

[7866] VGAM565 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM565 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7867] An enzyme complex designated DICER COMPLEX, dices the VGAM565 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM565 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM565 RNA is designated SEQ ID:3276, and is provided hereinbelow with reference to the sequence listing part.

[7868] VGAM565 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM565 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM565 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7869] VGAM565 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM565 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM565 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM565 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM565 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7870] The complementary binding of VGAM565 RNA, herein designated VGAM RNA, to host target binding sites on VGAM565 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM565 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM565 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7871] It is appreciated that VGAM565 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM565 host target genes. The mRNA of each one of this plurality of VGAM565 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM565 RNA, herein designated VGAM RNA, and which when bound by VGAM565 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM565 host target proteins.

[7872] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM565 gene, herein designated VGAM GENE, on one or more VGAM565 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7873] It is yet further appreciated that a function of VGAM565 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM565 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM565 correlate with, and may be deduced from, the identity of the host target genes which VGAM565 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7874] Nucleotide sequences of the VGAM565 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM565 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM565 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM565 are further de-

scribed hereinbelow with reference to Table 1.

[7875] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM565 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7876] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 566 (VGAM566) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7877] VGAM566 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM566 was detected is described hereinabove with reference to Figs. 2-8.

[7878] VGAM566 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM566 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7879] VGAM566 gene, herein designated VGAM GENE, encodes a VGAM566 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM566 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM566 precursor RNA is designated SEQ ID:552, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:552 is located at position 101053 relative to the genome of Fowlpox virus.

[7880] VGAM566 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM566 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7881] An enzyme complex designated DICER COMPLEX, dices the VGAM566 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM566 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM566 RNA is designated SEQ ID:3277, and is provided hereinbelow with reference to the sequence listing part.

[7882] VGAM566 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM566 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM566 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7883] VGAM566 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM566 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM566 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM566 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM566 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7884] The complementary binding of VGAM566 RNA, herein designated VGAM RNA, to host target binding sites on VGAM566 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM566 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM566 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7885] It is appreciated that VGAM566 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM566 host target genes. The mRNA of each one of this plurality of VGAM566 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM566 RNA, herein designated VGAM RNA, and which when bound by VGAM566 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM566 host target proteins.

[7886] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM566 gene, herein designated VGAM GENE, on one or more VGAM566 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7887] It is yet further appreciated that a function of VGAM566 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM566 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM566 correlate with, and may be deduced from, the identity of the host target genes which VGAM566 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7888] Nucleotide sequences of the VGAM566 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM566 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM566 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM566 are further described hereinbelow with reference to Table 1.

[7889] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM566 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7890] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 567 (VGAM567) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7891] VGAM567 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM567 was detected is described hereinabove with reference to Figs. 2-8.

[7892] VGAM567 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM567 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[7893] VGAM567 gene, herein designated VGAM GENE, encodes a VGAM567 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM567 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM567 precursor RNA is designated SEQ ID:553, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:553 is located at position 126386 relative to the genome of Fowlpox virus.

[7894] VGAM567 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM567 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7895] An enzyme complex designated DICER COMPLEX, dices

the VGAM567 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM567 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM567 RNA is designated SEQ ID:3278, and is provided hereinbelow with reference to the sequence listing part.

[7896] VGAM567 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM567 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM567 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7897] VGAM567 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM567 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM567 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM567 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM567 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7898] The complementary binding of VGAM567 RNA, herein designated VGAM RNA, to host target binding sites on VGAM567 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM567 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM567 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7899] It is appreciated that VGAM567 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM567 host target genes. The mRNA of each one of this plurality of VGAM567 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM567 RNA, herein designated VGAM RNA, and which when bound by VGAM567 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM567 host target proteins.

[7900] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM567 gene, herein designated VGAM GENE, on one or more VGAM567 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7901] It is yet further appreciated that a function of VGAM567 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM567 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM567 correlate with, and may be deduced from, the identity of the host target genes which VGAM567 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7902] Nucleotide sequences of the VGAM567 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM567 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM567 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM567 are further described hereinbelow with reference to Table 1.

[7903] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM567 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7904] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 568 (VGAM568) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7905] VGAM568 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM568 was detected is described hereinabove with reference to Figs. 2-8.

[7906] VGAM568 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM568 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[7907] VGAM568 gene, herein designated VGAM GENE, encodes a VGAM568 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM568 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM568 precursor RNA is designated SEQ ID:554, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:554 is located at position 123346 relative to the genome of Fowlpox virus.

[7908] VGAM568 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM568 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7909] An enzyme complex designated DICER COMPLEX, dices the VGAM568 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM568 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM568 RNA is designated SEQ ID:3279, and is provided hereinbelow with reference to the sequence listing part.

[7910] VGAM568 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM568 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM568 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7911] VGAM568 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM568 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM568 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM568 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM568 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7912] The complementary binding of VGAM568 RNA, herein designated VGAM RNA, to host target binding sites on VGAM568 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM568 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM568 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7913] It is appreciated that VGAM568 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM568 host target genes. The mRNA of each one of this plurality of VGAM568 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM568 RNA, herein designated VGAM RNA, and which when bound by VGAM568 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM568 host target proteins.

[7914] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM568 gene, herein designated VGAM GENE, on one or more VGAM568 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7915] It is yet further appreciated that a function of VGAM568 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM568 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM568 correlate with, and may be deduced from, the identity of the host target genes which VGAM568 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7916] Nucleotide sequences of the VGAM568 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM568 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM568 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM568 are further described hereinbelow with reference to Table 1.

[7917] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM568 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7918] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 569 (VGAM569) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7919] VGAM569 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM569 was detected is described hereinabove with reference to Figs. 2-8.

[7920] VGAM569 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM569 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7921] VGAM569 gene, herein designated VGAM GENE, encodes a VGAM569 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM569 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM569 precursor RNA is designated SEQ ID:555, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:555 is located at position 127302 relative to the genome of Fowlpox virus.

[7922] VGAM569 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM569 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[7923] An enzyme complex designated DICER COMPLEX, dices the VGAM569 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM569 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM569 RNA is designated SEQ ID:3280, and is provided hereinbelow with reference to the sequence listing part.

[7924] VGAM569 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM569 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM569 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7925] VGAM569 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM569 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM569 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM569 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM569 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7926] The complementary binding of VGAM569 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM569 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM569 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM569 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7927] It is appreciated that VGAM569 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM569 host target genes. The mRNA of each one of this plurality of VGAM569 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM569 RNA, herein designated VGAM RNA, and which when bound by VGAM569 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM569 host target proteins.

[7928] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM569 gene, herein designated VGAM GENE, on one or more VGAM569 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7929] It is yet further appreciated that a function of VGAM569 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM569 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM569 correlate with, and may be deduced from, the identity of the host target genes which VGAM569 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7930] Nucleotide sequences of the VGAM569 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM569 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM569 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM569 are further described hereinbelow with reference to Table 1.

[7931] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM569 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7932] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 570 (VGAM570) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7933] VGAM570 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM570 was detected is described hereinabove with reference to Figs. 2-8.

[7934] VGAM570 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Fowlpox virus.

VGAM570 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7935] VGAM570 gene, herein designated VGAM GENE, encodes a VGAM570 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM570 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM570 precursor RNA is designated SEQ ID:556, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:556 is located at position 124616 relative to the genome of Fowlpox virus.

[7936] VGAM570 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM570 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7937] An enzyme complex designated DICER COMPLEX, dices the VGAM570 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM570 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM570 RNA is designated SEQ ID:3281, and is provided hereinbelow with reference to the sequence listing part.

[7938] VGAM570 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM570 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM570 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7939] VGAM570 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM570 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM570 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM570 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM570 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7940] The complementary binding of VGAM570 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM570 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM570 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM570 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7941] It is appreciated that VGAM570 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM570 host target genes. The mRNA of each one of this plurality of VGAM570 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM570 RNA, herein designated VGAM RNA, and which when bound by VGAM570 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM570 host target proteins.

[7942] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM570 gene, herein designated VGAM GENE, on one or more VGAM570 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7943] It is yet further appreciated that a function of VGAM570 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM570 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM570 correlate with, and may be deduced from, the identity of the host target genes which VGAM570 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7944] Nucleotide sequences of the VGAM570 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM570 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM570 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM570 are further described hereinbelow with reference to Table 1.

[7945] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM570 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7946] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 571 (VGAM571) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7947] VGAM571 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM571 was detected is described hereinabove with reference to Figs. 2-8.

[7948] VGAM571 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM571 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7949] VGAM571 gene, herein designated VGAM GENE, encodes a VGAM571 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM571 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM571 precursor RNA is designated SEQ ID:557, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:557 is located at position 152048 relative to the genome of Fowlpox virus.

[7950] VGAM571 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM571 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7951] An enzyme complex designated DICER COMPLEX, dices the VGAM571 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM571 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM571 RNA is designated SEQ ID:3282, and is provided hereinbelow with reference to the sequence listing part.

[7952] VGAM571 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM571 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM571 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[7953] VGAM571 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM571 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM571 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM571 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM571 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7954] The complementary binding of VGAM571 RNA, herein designated VGAM RNA, to host target binding sites on VGAM571 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM571 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM571 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7955] It is appreciated that VGAM571 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM571 host target genes. The mRNA of each one of this plurality of VGAM571 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM571 RNA, herein designated VGAM RNA, and which when bound by VGAM571 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM571 host target proteins.

[7956] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM571 gene, herein designated VGAM GENE, on one or

more VGAM571 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7957] It is yet further appreciated that a function of VGAM571 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM571 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM571 correlate with, and may be deduced from, the identity of the host target genes which VGAM571 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7958] Nucleotide sequences of the VGAM571 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM571 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM571 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM571 are further described hereinbelow with reference to Table 1.

[7959] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM571 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7960] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 572 (VGAM572) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7961] VGAM572 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM572 was detected is described

hereinabove with reference to Figs. 2–8.

[7962] VGAM572 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM572 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7963] VGAM572 gene, herein designated VGAM GENE, encodes a VGAM572 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM572 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM572 precursor RNA is designated SEQ ID:558, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:558 is located at position 151611 relative to the genome of Fowlpox virus.

[7964] VGAM572 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM572 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7965] An enzyme complex designated DICER COMPLEX, dices the VGAM572 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM572 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM572 RNA is designated SEQ ID:3283, and is provided hereinbelow with reference to the sequence listing part.

[7966] VGAM572 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM572 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM572 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7967] VGAM572 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM572 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM572 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM572 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM572 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[7968] The complementary binding of VGAM572 RNA, herein designated VGAM RNA, to host target binding sites on VGAM572 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM572 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM572 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7969] It is appreciated that VGAM572 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM572 host target genes. The mRNA of each one of this plurality of VGAM572 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM572 RNA, herein designated VGAM RNA, and which when bound by VGAM572 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM572 host target proteins.

[7970] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM572 gene, herein designated VGAM GENE, on one or more VGAM572 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7971] It is yet further appreciated that a function of VGAM572 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM572 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM572 correlate with, and may be deduced from, the identity of the host target genes which VGAM572 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

[7972] Nucleotide sequences of the VGAM572 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM572 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM572 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM572 are further described hereinbelow with reference to Table 1.

[7973] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM572 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7974] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 573 (VGAM573) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7975] VGAM573 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM573 was detected is described hereinabove with reference to Figs. 2–8.

[7976] VGAM573 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM573 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7977] VGAM573 gene, herein designated VGAM GENE, encodes a VGAM573 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM573 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM573 precursor RNA is designated SEQ ID:559, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:559 is located at position 150116 relative to the genome of Fowlpox virus.

[7978] VGAM573 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM573 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7979] An enzyme complex designated DICER COMPLEX, dices the VGAM573 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM573 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM573 RNA is designated SEQ ID:3284, and is provided hereinbelow with reference to the sequence listing part.

[7980] VGAM573 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM573 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM573 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7981] VGAM573 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM573 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM573 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM573 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM573 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7982] The complementary binding of VGAM573 RNA, herein designated VGAM RNA, to host target binding sites on VGAM573 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM573 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM573 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7983] It is appreciated that VGAM573 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM573 host target genes. The mRNA of each one of this plurality of VGAM573 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM573 RNA, herein designated VGAM RNA, and which when bound by VGAM573 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM573 host target proteins.

[7984] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM573 gene, herein designated VGAM GENE, on one or more VGAM573 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7985] It is yet further appreciated that a function of VGAM573 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM573 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM573 correlate with, and may be deduced from, the identity of the host target genes which VGAM573 binds and inhibits, and the

function of these host target genes, as elaborated herein—below.

[7986] Nucleotide sequences of the VGAM573 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM573 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM573 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM573 are further described hereinbelow with reference to Table 1.

[7987] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM573 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7988] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 574 (VGAM574) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7989] VGAM574 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM574 was detected is described hereinabove with reference to Figs. 2–8.

[7990] VGAM574 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM574 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7991] VGAM574 gene, herein designated VGAM GENE, encodes a VGAM574 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM574 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM574 precursor RNA is designated SEQ ID:560, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:560 is located at position 151276 relative to the genome of Fowlpox virus.

[7992] VGAM574 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM574 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7993] An enzyme complex designated DICER COMPLEX, dices the VGAM574 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM574 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM574 RNA is designated SEQ ID:3285, and is provided hereinbelow with reference to the sequence listing part.

[7994] VGAM574 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM574 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM574 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[7995] VGAM574 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM574 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM574 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM574 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM574 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[7996] The complementary binding of VGAM574 RNA, herein designated VGAM RNA, to host target binding sites on VGAM574 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM574 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM574 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7997] It is appreciated that VGAM574 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM574 host target genes. The mRNA of each one of this plurality of VGAM574 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM574 RNA, herein designated VGAM RNA, and which when bound by VGAM574 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM574 host target proteins.

[7998] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM574 gene, herein designated VGAM GENE, on one or more VGAM574 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[7999] It is yet further appreciated that a function of VGAM574 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM574 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM574 correlate with, and may be deduced from, the identity of the host

target genes which VGAM574 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8000] Nucleotide sequences of the VGAM574 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM574 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM574 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM574 are further described hereinbelow with reference to Table 1.

[8001] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM574 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8002] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 575 (VGAM575) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8003] VGAM575 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM575 was detected is described hereinabove with reference to Figs. 2–8.

[8004] VGAM575 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM575 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8005] VGAM575 gene, herein designated VGAM GENE, encodes a VGAM575 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM575 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM575 precursor RNA is designated SEQ ID:561, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:561 is located at position 159770 relative to the genome of Fowlpox virus.

[8006] VGAM575 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM575 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8007] An enzyme complex designated DICER COMPLEX, dices the VGAM575 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM575 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM575 RNA is designated SEQ ID:3286, and is provided hereinbelow with reference to the sequence listing part.

[8008] VGAM575 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM575 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM575 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8009] VGAM575 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM575 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM575 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM575 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM575 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8010] The complementary binding of VGAM575 RNA, herein designated VGAM RNA, to host target binding sites on VGAM575 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM575 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM575 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8011] It is appreciated that VGAM575 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM575 host target genes. The mRNA of each one of this plurality of VGAM575 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM575 RNA, herein designated VGAM RNA, and which when bound by VGAM575 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM575 host target proteins.

[8012] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM575 gene, herein designated VGAM GENE, on one or more VGAM575 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8013] It is yet further appreciated that a function of VGAM575 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM575 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM575 correlate

with, and may be deduced from, the identity of the host target genes which VGAM575 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8014] Nucleotide sequences of the VGAM575 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM575 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM575 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM575 are further described hereinbelow with reference to Table 1.

[8015] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM575 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8016] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 576 (VGAM576) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[8017] VGAM576 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM576 was detected is described hereinabove with reference to Figs. 2–8.

[8018] VGAM576 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM576 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8019] VGAM576 gene, herein designated VGAM GENE, encodes a VGAM576 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM576 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM576 precursor RNA is designated SEQ ID:562, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:562 is located at position 160178 relative to the genome of Fowlpox virus.

[8020] VGAM576 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM576 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8021] An enzyme complex designated DICER COMPLEX, dices the VGAM576 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM576 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM576 RNA is designated SEQ ID:3287, and is provided hereinbelow with reference to the sequence listing part.

[8022] VGAM576 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM576 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM576 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8023] VGAM576 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM576 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM576 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM576 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM576 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8024] The complementary binding of VGAM576 RNA, herein designated VGAM RNA, to host target binding sites on VGAM576 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM576 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM576 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8025] It is appreciated that VGAM576 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM576 host target genes. The mRNA of each one of this plurality of VGAM576 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM576 RNA, herein designated VGAM RNA, and which when bound by VGAM576 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM576 host target proteins.

[8026] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM576 gene, herein designated VGAM GENE, on one or more VGAM576 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8027] It is yet further appreciated that a function of VGAM576 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM576 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific

functions, and accordingly utilities, of VGAM576 correlate with, and may be deduced from, the identity of the host target genes which VGAM576 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8028] Nucleotide sequences of the VGAM576 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM576 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM576 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM576 are further described hereinbelow with reference to Table 1.

[8029] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM576 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8030] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 577 (VGAM577) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[8031] VGAM577 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM577 was detected is described hereinabove with reference to Figs. 2–8.

[8032] VGAM577 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM577 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8033] VGAM577 gene, herein designated VGAM GENE, encodes a VGAM577 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM577 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM577 precursor RNA is designated SEQ ID:563, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:563 is located at position 170504 relative to the genome of Fowlpox virus.

[8034] VGAM577 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM577 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8035] An enzyme complex designated DICER COMPLEX, dices the VGAM577 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM577 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM577 RNA is designated SEQ ID:3288, and is provided hereinbelow with reference to the sequence listing part.

[8036] VGAM577 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM577 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM577 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8037] VGAM577 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM577 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM577 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM577 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM577 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8038] The complementary binding of VGAM577 RNA, herein designated VGAM RNA, to host target binding sites on VGAM577 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM577 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM577 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8039] It is appreciated that VGAM577 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM577 host target genes. The mRNA of each one of this plurality of VGAM577 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM577 RNA, herein designated VGAM RNA, and which when bound by VGAM577 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM577 host target proteins.

[8040] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM577 gene, herein designated VGAM GENE, on one or more VGAM577 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8041] It is yet further appreciated that a function of VGAM577 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM577 include diagnosis, prevention and

treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM577 correlate with, and may be deduced from, the identity of the host target genes which VGAM577 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8042] Nucleotide sequences of the VGAM577 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM577 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM577 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM577 are further described hereinbelow with reference to Table 1.

[8043] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM577 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8044] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 578 (VGAM578) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8045] VGAM578 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM578 was detected is described hereinabove with reference to Figs. 2–8.

[8046] VGAM578 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM578 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8047] VGAM578 gene, herein designated VGAM GENE, encodes a VGAM578 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM578 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM578 precursor RNA is designated SEQ ID:564, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:564 is located at position 168962 relative to the genome of Fowlpox virus.

[8048] VGAM578 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM578 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8049] An enzyme complex designated DICER COMPLEX, dices the VGAM578 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM578 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM578 RNA is designated SEQ ID:3289, and is provided hereinbelow with reference to the sequence listing part.

[8050] VGAM578 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM578 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM578 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8051] VGAM578 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM578 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM578 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM578 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM578 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8052] The complementary binding of VGAM578 RNA, herein designated VGAM RNA, to host target binding sites on VGAM578 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM578 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM578 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8053] It is appreciated that VGAM578 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM578 host target genes. The mRNA of each one of this plurality of VGAM578 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM578 RNA, herein designated VGAM

RNA, and which when bound by VGAM578 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM578 host target proteins.

[8054] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM578 gene, herein designated VGAM GENE, on one or more VGAM578 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8055] It is yet further appreciated that a function of VGAM578 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM578 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM578 correlate with, and may be deduced from, the identity of the host target genes which VGAM578 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8056] Nucleotide sequences of the VGAM578 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM578 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM578 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM578 are further described hereinbelow with reference to Table 1.

[8057] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM578 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8058] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 579 (VGAM579) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8059] VGAM579 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM579 was detected is described hereinabove with reference to Figs. 2–8.

[8060] VGAM579 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM579 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8061] VGAM579 gene, herein designated VGAM GENE, encodes a VGAM579 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM579 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM579 precursor RNA is designated SEQ ID:565, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:565 is located at position 219679 relative

to the genome of Fowlpox virus.

[8062] VGAM579 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM579 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8063] An enzyme complex designated DICER COMPLEX, dices the VGAM579 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM579 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM579 RNA is designated SEQ ID:3290, and is provided hereinbelow with reference to the sequence listing part.

[8064] VGAM579 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM579 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM579 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8065] VGAM579 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM579 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM579 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM579 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM579 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8066] The complementary binding of VGAM579 RNA, herein designated VGAM RNA, to host target binding sites on VGAM579 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM579 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM579 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8067] It is appreciated that VGAM579 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM579 host target genes. The mRNA of each one of this plurality of VGAM579 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM579 RNA, herein designated VGAM RNA, and which when bound by VGAM579 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM579 host target proteins.

[8068] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM579 gene, herein designated VGAM GENE, on one or more VGAM579 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8069] It is yet further appreciated that a function of VGAM579 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM579 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM579 correlate with, and may be deduced from, the identity of the host target genes which VGAM579 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8070] Nucleotide sequences of the VGAM579 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM579 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM579 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM579 are further described hereinbelow with reference to Table 1.

[8071] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM579 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8072] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 580 (VGAM580) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8073] VGAM580 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM580 was detected is described hereinabove with reference to Figs. 2–8.

[8074] VGAM580 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM580 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8075] VGAM580 gene, herein designated VGAM GENE, encodes a VGAM580 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM580 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM580 precursor RNA is designated SEQ ID:566, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:566 is located at position 244009 relative to the genome of Fowlpox virus.

[8076] VGAM580 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM580 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8077] An enzyme complex designated DICER COMPLEX, dices the VGAM580 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM580 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM580 RNA is designated SEQ ID:3291, and is provided hereinbelow with reference to the sequence

listing part.

[8078] VGAM580 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM580 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM580 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8079] VGAM580 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM580 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM580 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM580 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM580 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8080] The complementary binding of VGAM580 RNA, herein designated VGAM RNA, to host target binding sites on VGAM580 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM580 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM580 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8081] It is appreciated that VGAM580 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM580 host target genes. The mRNA of each one of this plurality of VGAM580 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM580 RNA, herein designated VGAM RNA, and which when bound by VGAM580 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM580 host target proteins.

[8082] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM580 gene, herein designated VGAM GENE, on one or more VGAM580 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8083] It is yet further appreciated that a function of VGAM580 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM580 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM580 correlate with, and may be deduced from, the identity of the host target genes which VGAM580 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8084] Nucleotide sequences of the VGAM580 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM580 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM580 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM580 are further described hereinbelow with reference to Table 1.

[8085] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM580 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8086] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 581 (VGAM581) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8087] VGAM581 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM581 was detected is described hereinabove with reference to Figs. 2–8.

[8088] VGAM581 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM581 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8089] VGAM581 gene, herein designated VGAM GENE, encodes a VGAM581 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM581 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM581 precursor RNA is designated SEQ ID:567, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:567 is located at position 244236 relative to the genome of Fowlpox virus.

[8090] VGAM581 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM581 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8091] An enzyme complex designated DICER COMPLEX, dices the VGAM581 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM581 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of VGAM581 RNA is designated SEQ ID:3292, and

is provided hereinbelow with reference to the sequence listing part.

[8092] VGAM581 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM581 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM581 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8093] VGAM581 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM581 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM581 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM581 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM581 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8094] The complementary binding of VGAM581 RNA, herein designated VGAM RNA, to host target binding sites on VGAM581 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM581 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM581 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8095] It is appreciated that VGAM581 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM581 host target genes. The mRNA of each one of this plurality of VGAM581 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM581 RNA, herein designated VGAM RNA, and which when bound by VGAM581 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM581 host target proteins.

[8096] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM581 gene, herein designated VGAM GENE, on one or more VGAM581 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8097] It is yet further appreciated that a function of VGAM581 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM581 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM581 correlate with, and may be deduced from, the identity of the host target genes which VGAM581 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8098] Nucleotide sequences of the VGAM581 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM581 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM581 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM581 are further described hereinbelow with reference to Table 1.

[8099] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM581 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8100] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 582 (VGAM582) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8101] VGAM582 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM582 was detected is described hereinabove with reference to Figs. 2–8.

[8102] VGAM582 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM582 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8103] VGAM582 gene, herein designated VGAM GENE, encodes a VGAM582 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM582 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM582 precursor RNA is

designated SEQ ID:568, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:568 is located at position 251054 relative to the genome of Fowlpox virus.

[8104] VGAM582 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM582 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8105] An enzyme complex designated DICER COMPLEX, dices the VGAM582 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM582 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide se-

quence of VGAM582 RNA is designated SEQ ID:3293, and is provided hereinbelow with reference to the sequence listing part.

[8106] VGAM582 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM582 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM582 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8107] VGAM582 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM582 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM582 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM582 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM582 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8108] The complementary binding of VGAM582 RNA, herein designated VGAM RNA, to host target binding sites on VGAM582 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM582 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM582 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8109] It is appreciated that VGAM582 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM582 host target genes. The mRNA of

each one of this plurality of VGAM582 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM582 RNA, herein designated VGAM RNA, and which when bound by VGAM582 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM582 host target proteins.

[8110] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM582 gene, herein designated VGAM GENE, on one or more VGAM582 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[8111] It is yet further appreciated that a function of VGAM582 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM582 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM582 correlate with, and may be deduced from, the identity of the host target genes which VGAM582 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8112] Nucleotide sequences of the VGAM582 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM582 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM582 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM582 are further described hereinbelow with reference to Table 1.

[8113] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM582 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[8114] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 583 (VGAM583) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8115] VGAM583 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM583 was detected is described hereinabove with reference to Figs. 2–8.

[8116] VGAM583 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM583 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8117] VGAM583 gene, herein designated VGAM GENE, encodes a VGAM583 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM583 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM583 precursor RNA is designated SEQ ID:569, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:569 is located at position 274080 relative to the genome of Fowlpox virus.

[8118] VGAM583 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM583 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8119] An enzyme complex designated DICER COMPLEX, dices the VGAM583 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM583 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 71%) nucleotide sequence of VGAM583 RNA is designated SEQ ID:3294, and is provided hereinbelow with reference to the sequence listing part.

[8120] VGAM583 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM583 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM583 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8121] VGAM583 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM583 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM583 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM583 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM583 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8122] The complementary binding of VGAM583 RNA, herein designated VGAM RNA, to host target binding sites on VGAM583 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM583 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM583 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8123] It is appreciated that VGAM583 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM583 host target genes. The mRNA of each one of this plurality of VGAM583 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM583 RNA, herein designated VGAM RNA, and which when bound by VGAM583 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM583 host target proteins.

[8124] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM583 gene, herein designated VGAM GENE, on one or more VGAM583 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[8125] It is yet further appreciated that a function of VGAM583 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM583 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM583 correlate with, and may be deduced from, the identity of the host target genes which VGAM583 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[8126] Nucleotide sequences of the VGAM583 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM583 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM583 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM583 are further described hereinbelow with reference to Table 1.

[8127] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM583 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8128] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 584 (VGAM584) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8129] VGAM584 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM584 was detected is described hereinabove with reference to Figs. 2–8.

[8130] VGAM584 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM584 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8131] VGAM584 gene, herein designated VGAM GENE, encodes a VGAM584 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM584 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM584 precursor RNA is designated SEQ ID:570, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:570 is located at position 54006 relative to the genome of Fowlpox virus.

[8132] VGAM584 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM584 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8133] An enzyme complex designated DICER COMPLEX, dices the VGAM584 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM584 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM584 RNA is designated SEQ ID:3295, and is provided hereinbelow with reference to the sequence listing part.

[8134] VGAM584 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM584 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM584 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8135] VGAM584 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM584 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM584 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM584 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM584 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8136] The complementary binding of VGAM584 RNA, herein designated VGAM RNA, to host target binding sites on VGAM584 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM584 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM584 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8137] It is appreciated that VGAM584 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM584 host target genes. The mRNA of each one of this plurality of VGAM584 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM584 RNA, herein designated VGAM RNA, and which when bound by VGAM584 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM584 host target proteins.

[8138] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM584 gene, herein designated VGAM GENE, on one or more VGAM584 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8139] It is yet further appreciated that a function of VGAM584 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM584 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM584 correlate with, and may be deduced from, the identity of the host target genes which VGAM584 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8140] Nucleotide sequences of the VGAM584 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM584 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM584 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM584 are further described hereinbelow with reference to Table 1.

[8141] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM584 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8142] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 585 (VGAM585) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8143] VGAM585 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM585 was detected is described hereinabove with reference to Figs. 2–8.

[8144] VGAM585 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM585 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8145] VGAM585 gene, herein designated VGAM GENE, encodes a VGAM585 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM585 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM585 precursor RNA is designated SEQ ID:571, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:571 is located at position 24033 relative to the genome of Gallid herpesvirus 2.

[8146] VGAM585 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM585 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8147] An enzyme complex designated DICER COMPLEX, dices the VGAM585 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM585 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM585 RNA is designated SEQ ID:3296, and is provided hereinbelow with reference to the sequence listing part.

[8148] VGAM585 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM585 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM585 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8149] VGAM585 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM585 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM585 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM585 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM585 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8150] The complementary binding of VGAM585 RNA, herein designated VGAM RNA, to host target binding sites on VGAM585 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM585 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM585 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8151] It is appreciated that VGAM585 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM585 host target genes. The mRNA of each one of this plurality of VGAM585 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM585 RNA, herein designated VGAM RNA, and which when bound by VGAM585 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM585 host target proteins.

[8152] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM585 gene, herein designated VGAM GENE, on one or more VGAM585 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8153] It is yet further appreciated that a function of VGAM585 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM585 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM585 correlate with, and may be deduced from, the identity of the host target genes which VGAM585 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8154] Nucleotide sequences of the VGAM585 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM585 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM585 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM585 are further described hereinbelow with reference to Table 1.

[8155] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM585 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8156] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 586 (VGAM586) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8157] VGAM586 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM586 was detected is described hereinabove with reference to Figs. 2–8.

[8158] VGAM586 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM586 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8159] VGAM586 gene, herein designated VGAM GENE, encodes a VGAM586 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM586 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM586 precursor RNA is designated SEQ ID:572, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:572 is located at position 25576 relative to the genome of Gallid herpesvirus 2.

[8160] VGAM586 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM586 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8161] An enzyme complex designated DICER COMPLEX, dices the VGAM586 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM586 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM586 RNA is designated SEQ ID:3297, and is provided hereinbelow with reference to the sequence listing part.

[8162] VGAM586 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM586 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM586 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8163] VGAM586 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM586 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM586 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM586 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM586 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8164] The complementary binding of VGAM586 RNA, herein designated VGAM RNA, to host target binding sites on VGAM586 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM586 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM586 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[8165] It is appreciated that VGAM586 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM586 host target genes. The mRNA of each one of this plurality of VGAM586 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM586 RNA, herein designated VGAM RNA, and which when bound by VGAM586 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM586 host target proteins.

[8166] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM586 gene, herein designated VGAM GENE, on one or more VGAM586 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8167] It is yet further appreciated that a function of VGAM586 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM586 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM586 correlate with, and may be deduced from, the identity of the host target genes which VGAM586 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8168] Nucleotide sequences of the VGAM586 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM586 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM586 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM586 are further described hereinbelow with reference to Table 1.

[8169] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM586 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8170] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 587 (VGAM587) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8171] VGAM587 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM587 was detected is described hereinabove with reference to Figs. 2–8.

[8172] VGAM587 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM587 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8173] VGAM587 gene, herein designated VGAM GENE, encodes a VGAM587 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM587 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM587 precursor RNA is designated SEQ ID:573, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:573 is located at position 24271 relative to the genome of Gallid herpesvirus 2.

[8174] VGAM587 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM587 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8175] An enzyme complex designated DICER COMPLEX, dices the VGAM587 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM587 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM587 RNA is designated SEQ ID:3298, and is provided hereinbelow with reference to the sequence listing part.

[8176] VGAM587 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM587 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM587 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8177] VGAM587 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM587 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM587 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM587 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM587 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8178] The complementary binding of VGAM587 RNA, herein designated VGAM RNA, to host target binding sites on VGAM587 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM587 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM587 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8179] It is appreciated that VGAM587 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM587 host target genes. The mRNA of each one of this plurality of VGAM587 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM587 RNA, herein designated VGAM RNA, and which when bound by VGAM587 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM587 host target proteins.

[8180] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM587 gene, herein designated VGAM GENE, on one or more VGAM587 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8181] It is yet further appreciated that a function of VGAM587 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM587 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM587 cor-

relate with, and may be deduced from, the identity of the host target genes which VGAM587 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8182] Nucleotide sequences of the VGAM587 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM587 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM587 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM587 are further described hereinbelow with reference to Table 1.

[8183] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM587 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8184] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 588 (VGAM588) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[8185] VGAM588 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM588 was detected is described hereinabove with reference to Figs. 2–8.

[8186] VGAM588 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM588 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8187] VGAM588 gene, herein designated VGAM GENE, encodes a VGAM588 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM588 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM588 precursor RNA is designated SEQ ID:574, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:574 is located at position 41654 relative to the genome of Gallid herpesvirus 2.

[8188] VGAM588 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM588 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8189] An enzyme complex designated DICER COMPLEX, dices the VGAM588 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM588 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM588 RNA is designated SEQ ID:3299, and is provided hereinbelow with reference to the sequence listing part.

[8190] VGAM588 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM588 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM588 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8191] VGAM588 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM588 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM588 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM588 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM588 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8192] The complementary binding of VGAM588 RNA, herein designated VGAM RNA, to host target binding sites on VGAM588 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM588 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM588 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8193] It is appreciated that VGAM588 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM588 host target genes. The mRNA of each one of this plurality of VGAM588 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM588 RNA, herein designated VGAM RNA, and which when bound by VGAM588 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM588 host target proteins.

[8194] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM588 gene, herein designated VGAM GENE, on one or more VGAM588 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8195] It is yet further appreciated that a function of VGAM588 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM588 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Spe-

cific functions, and accordingly utilities, of VGAM588 correlate with, and may be deduced from, the identity of the host target genes which VGAM588 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8196] Nucleotide sequences of the VGAM588 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the duced VGAM588 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM588 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM588 are further described hereinbelow with reference to Table 1.

[8197] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM588 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8198] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 589 (VGAM589) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[8199] VGAM589 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM589 was detected is described hereinabove with reference to Figs. 2–8.

[8200] VGAM589 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM589 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8201] VGAM589 gene, herein designated VGAM GENE, encodes a VGAM589 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM589 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM589 precursor RNA is designated SEQ ID:575, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:575 is located at position 37271 relative to the genome of Gallid herpesvirus 2.

[8202] VGAM589 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM589 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8203] An enzyme complex designated DICER COMPLEX, dices the VGAM589 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM589 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM589 RNA is designated SEQ ID:3300, and is provided hereinbelow with reference to the sequence listing part.

[8204] VGAM589 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM589 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM589 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8205] VGAM589 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM589 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM589 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM589 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM589 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8206] The complementary binding of VGAM589 RNA, herein designated VGAM RNA, to host target binding sites on VGAM589 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM589 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM589 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8207] It is appreciated that VGAM589 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM589 host target genes. The mRNA of each one of this plurality of VGAM589 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM589 RNA, herein designated VGAM RNA, and which when bound by VGAM589 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM589 host target proteins.

[8208] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM589 gene, herein designated VGAM GENE, on one or more VGAM589 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8209] It is yet further appreciated that a function of VGAM589 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM589 include diagnosis, prevention and

treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM589 correlate with, and may be deduced from, the identity of the host target genes which VGAM589 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8210] Nucleotide sequences of the VGAM589 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM589 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM589 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM589 are further described hereinbelow with reference to Table 1.

[8211] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM589 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8212] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 590 (VGAM590) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8213] VGAM590 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM590 was detected is described hereinabove with reference to Figs. 2–8.

[8214] VGAM590 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM590 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8215] VGAM590 gene, herein designated VGAM GENE, encodes a VGAM590 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM590 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM590 precursor RNA is designated SEQ ID:576, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:576 is located at position 37055 relative to the genome of Gallid herpesvirus 2.

[8216] VGAM590 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM590 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8217] An enzyme complex designated DICER COMPLEX, dices the VGAM590 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM590 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM590 RNA is designated SEQ ID:3301, and is provided hereinbelow with reference to the sequence listing part.

[8218] VGAM590 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM590 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM590 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8219] VGAM590 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM590 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM590 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM590 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM590 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8220] The complementary binding of VGAM590 RNA, herein designated VGAM RNA, to host target binding sites on VGAM590 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM590 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM590 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8221] It is appreciated that VGAM590 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM590 host target genes. The mRNA of each one of this plurality of VGAM590 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM590 RNA, herein designated VGAM

RNA, and which when bound by VGAM590 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM590 host target proteins.

[8222] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM590 gene, herein designated VGAM GENE, on one or more VGAM590 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8223] It is yet further appreciated that a function of VGAM590 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM590 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM590 correlate with, and may be deduced from, the identity of the host target genes which VGAM590 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8224] Nucleotide sequences of the VGAM590 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM590 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM590 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM590 are further described hereinbelow with reference to Table 1.

[8225] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM590 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8226] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 591 (VGAM591) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8227] VGAM591 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM591 was detected is described hereinabove with reference to Figs. 2–8.

[8228] VGAM591 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM591 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8229] VGAM591 gene, herein designated VGAM GENE, encodes a VGAM591 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM591 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM591 precursor RNA is designated SEQ ID:577, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:577 is located at position 47365 relative to

the genome of Gallid herpesvirus 2.

[8230] VGAM591 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM591 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8231] An enzyme complex designated DICER COMPLEX, dices the VGAM591 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM591 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM591 RNA is designated SEQ ID:3302, and is provided hereinbelow with reference to the sequence listing part.

[8232] VGAM591 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM591 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM591 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[8233] VGAM591 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM591 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM591 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM591 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM591 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8234] The complementary binding of VGAM591 RNA, herein designated VGAM RNA, to host target binding sites on VGAM591 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM591 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM591 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8235] It is appreciated that VGAM591 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM591 host target genes. The mRNA of each one of this plurality of VGAM591 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM591 RNA, herein designated VGAM RNA, and which when bound by VGAM591 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM591 host target proteins.

[8236] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM591 gene, herein designated VGAM GENE, on one or more VGAM591 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8237] It is yet further appreciated that a function of VGAM591 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM591 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM591 correlate with, and may be deduced from, the identity of the host target genes which VGAM591 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8238] Nucleotide sequences of the VGAM591 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM591 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM591 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM591 are further described hereinbelow with reference to Table 1.

[8239] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM591 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8240] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 592 (VGAM592) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8241] VGAM592 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM592 was detected is described hereinabove with reference to Figs. 2–8.

[8242] VGAM592 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM592 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8243] VGAM592 gene, herein designated VGAM GENE, encodes a VGAM592 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM592 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM592 precursor RNA is designated SEQ ID:578, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:578 is located at position 44626 relative to the genome of Gallid herpesvirus 2.

[8244] VGAM592 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM592 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8245] An enzyme complex designated DICER COMPLEX, dices the VGAM592 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM592 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM592 RNA is designated SEQ ID:3303, and is provided hereinbelow with reference to the sequence

listing part.

[8246] VGAM592 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM592 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM592 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8247] VGAM592 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM592 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM592 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM592 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM592 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8248] The complementary binding of VGAM592 RNA, herein designated VGAM RNA, to host target binding sites on VGAM592 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM592 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM592 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8249] It is appreciated that VGAM592 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM592 host target genes. The mRNA of each one of this plurality of VGAM592 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM592 RNA, herein designated VGAM RNA, and which when bound by VGAM592 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM592 host target proteins.

[8250] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM592 gene, herein designated VGAM GENE, on one or more VGAM592 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8251] It is yet further appreciated that a function of VGAM592 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM592 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM592 correlate with, and may be deduced from, the identity of the host target genes which VGAM592 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8252] Nucleotide sequences of the VGAM592 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM592 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM592 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM592 are further described hereinbelow with reference to Table 1.

[8253] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM592 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8254] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 593 (VGAM593) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8255] VGAM593 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM593 was detected is described hereinabove with reference to Figs. 2–8.

[8256] VGAM593 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM593 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8257] VGAM593 gene, herein designated VGAM GENE, encodes a VGAM593 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM593 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM593 precursor RNA is designated SEQ ID:579, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:579 is located at position 75792 relative to the genome of Gallid herpesvirus 2.

[8258] VGAM593 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM593 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8259] An enzyme complex designated DICER COMPLEX, dices the VGAM593 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM593 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM593 RNA is designated SEQ ID:3304, and

is provided hereinbelow with reference to the sequence listing part.

[8260] VGAM593 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM593 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM593 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8261] VGAM593 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM593 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM593 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM593 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM593 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8262] The complementary binding of VGAM593 RNA, herein designated VGAM RNA, to host target binding sites on VGAM593 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM593 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM593 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8263] It is appreciated that VGAM593 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM593 host target genes. The mRNA of each one of this plurality of VGAM593 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM593 RNA, herein designated VGAM RNA, and which when bound by VGAM593 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM593 host target proteins.

[8264] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM593 gene, herein designated VGAM GENE, on one or more VGAM593 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8265] It is yet further appreciated that a function of VGAM593 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM593 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM593 correlate with, and may be deduced from, the identity of the host target genes which VGAM593 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8266] Nucleotide sequences of the VGAM593 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM593 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM593 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM593 are further described hereinbelow with reference to Table 1.

[8267] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM593 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8268] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 594 (VGAM594) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8269] VGAM594 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM594 was detected is described hereinabove with reference to Figs. 2–8.

[8270] VGAM594 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Northern cereal mosaic virus. VGAM594 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8271] VGAM594 gene, herein designated VGAM GENE, encodes a VGAM594 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM594 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM594 precursor RNA is

designated SEQ ID:580, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:580 is located at position 8565 relative to the genome of Northern cereal mosaic virus.

[8272] VGAM594 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM594 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8273] An enzyme complex designated DICER COMPLEX, dices the VGAM594 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM594 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM594 RNA is designated SEQ ID:3305, and is provided hereinbelow with reference to the sequence listing part.

[8274] VGAM594 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM594 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM594 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8275] VGAM594 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM594 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM594 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM594 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM594 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8276] The complementary binding of VGAM594 RNA, herein designated VGAM RNA, to host target binding sites on VGAM594 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM594 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM594 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8277] It is appreciated that VGAM594 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM594 host target genes. The mRNA of

each one of this plurality of VGAM594 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM594 RNA, herein designated VGAM RNA, and which when bound by VGAM594 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM594 host target proteins.

[8278] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM594 gene, herein designated VGAM GENE, on one or more VGAM594 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[8279] It is yet further appreciated that a function of VGAM594 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM594 include diagnosis, prevention and treatment of viral infection by Northern cereal mosaic virus. Specific functions, and accordingly utilities, of VGAM594 correlate with, and may be deduced from, the identity of the host target genes which VGAM594 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8280] Nucleotide sequences of the VGAM594 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM594 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM594 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM594 are further described hereinbelow with reference to Table 1.

[8281] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM594 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[8282] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 595 (VGAM595) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8283] VGAM595 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM595 was detected is described hereinabove with reference to Figs. 2–8.

[8284] VGAM595 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Northern cereal mosaic virus. VGAM595 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8285] VGAM595 gene, herein designated VGAM GENE, encodes a VGAM595 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM595 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM595 precursor RNA is designated SEQ ID:581, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:581 is located at position 9694 relative to the genome of Northern cereal mosaic virus.

[8286] VGAM595 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM595 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8287] An enzyme complex designated DICER COMPLEX, dices the VGAM595 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM595 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM595 RNA is designated SEQ ID:3306, and is provided hereinbelow with reference to the sequence listing part.

[8288] VGAM595 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM595 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM595 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8289] VGAM595 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM595 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM595 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM595 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM595 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8290] The complementary binding of VGAM595 RNA, herein designated VGAM RNA, to host target binding sites on VGAM595 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM595 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM595 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8291] It is appreciated that VGAM595 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM595 host target genes. The mRNA of each one of this plurality of VGAM595 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM595 RNA, herein designated VGAM RNA, and which when bound by VGAM595 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM595 host target proteins.

[8292] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM595 gene, herein designated VGAM GENE, on one or more VGAM595 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[8293] It is yet further appreciated that a function of VGAM595 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM595 include diagnosis, prevention and treatment of viral infection by Northern cereal mosaic virus. Specific functions, and accordingly utilities, of VGAM595 correlate with, and may be deduced from, the identity of the host target genes which VGAM595 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8294] Nucleotide sequences of the VGAM595 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM595 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM595 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM595 are further described hereinbelow with reference to Table 1.

[8295] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM595 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8296] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 596 (VGAM596) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8297] VGAM596 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM596 was detected is described hereinabove with reference to Figs. 2–8.

[8298] VGAM596 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Northern cereal mosaic virus. VGAM596 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8299] VGAM596 gene, herein designated VGAM GENE, encodes a VGAM596 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM596 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM596 precursor RNA is designated SEQ ID:582, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:582 is located at position 12057 relative to the genome of Northern cereal mosaic virus.

[8300] VGAM596 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM596 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8301] An enzyme complex designated DICER COMPLEX, dices the VGAM596 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM596 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM596 RNA is designated SEQ ID:3307, and is provided hereinbelow with reference to the sequence listing part.

[8302] VGAM596 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM596 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM596 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8303] VGAM596 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM596 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM596 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM596 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM596 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8304] The complementary binding of VGAM596 RNA, herein designated VGAM RNA, to host target binding sites on VGAM596 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM596 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM596 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8305] It is appreciated that VGAM596 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM596 host target genes. The mRNA of each one of this plurality of VGAM596 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM596 RNA, herein designated VGAM RNA, and which when bound by VGAM596 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM596 host target proteins.

[8306] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM596 gene, herein designated VGAM GENE, on one or more VGAM596 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8307] It is yet further appreciated that a function of VGAM596 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM596 include diagnosis, prevention and treatment of viral infection by Northern cereal mosaic virus. Specific functions, and accordingly utilities, of VGAM596 correlate with, and may be deduced from, the identity of the host target genes which VGAM596 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8308] Nucleotide sequences of the VGAM596 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM596 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM596 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM596 are further described hereinbelow with reference to Table 1.

[8309] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM596 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8310] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 597 (VGAM597) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8311] VGAM597 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM597 was detected is described hereinabove with reference to Figs. 2–8.

[8312] VGAM597 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible gastroenteritis virus. VGAM597 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8313] VGAM597 gene, herein designated VGAM GENE, encodes a VGAM597 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM597 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM597 precursor RNA is designated SEQ ID:583, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:583 is located at position 10633 relative to the genome of Transmissible gastroenteritis virus.

[8314] VGAM597 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM597 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8315] An enzyme complex designated DICER COMPLEX, dices the VGAM597 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM597 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM597 RNA is designated SEQ ID:3308, and is provided hereinbelow with reference to the sequence listing part.

[8316] VGAM597 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM597 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM597 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8317] VGAM597 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM597 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM597 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM597 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM597 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8318] The complementary binding of VGAM597 RNA, herein designated VGAM RNA, to host target binding sites on VGAM597 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM597 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM597 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8319] It is appreciated that VGAM597 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM597 host target genes. The mRNA of each one of this plurality of VGAM597 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM597 RNA, herein designated VGAM RNA, and which when bound by VGAM597 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM597 host target proteins.

[8320] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM597 gene, herein designated VGAM GENE, on one or more VGAM597 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8321] It is yet further appreciated that a function of VGAM597 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM597 include diagnosis, prevention and treatment of viral infection by Transmissible gastroenteritis virus. Specific functions, and accordingly utilities, of VGAM597 correlate with, and may be deduced from, the identity of the host target genes which VGAM597 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8322] Nucleotide sequences of the VGAM597 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM597 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM597 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM597 are further described hereinbelow with reference to Table 1.

[8323] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM597 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8324] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 598 (VGAM598) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8325] VGAM598 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM598 was detected is described hereinabove with reference to Figs. 2–8.

[8326] VGAM598 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible gastroenteritis virus. VGAM598 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8327] VGAM598 gene, herein designated VGAM GENE, encodes a VGAM598 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM598 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM598 precursor RNA is designated SEQ ID:584, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:584 is located at position 7593 relative to the genome of Transmissible gastroenteritis virus.

[8328] VGAM598 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM598 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8329] An enzyme complex designated DICER COMPLEX, dices the VGAM598 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM598 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM598 RNA is designated SEQ ID:3309, and is provided hereinbelow with reference to the sequence listing part.

[8330] VGAM598 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM598 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM598 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8331] VGAM598 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM598 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM598 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM598 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM598 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8332] The complementary binding of VGAM598 RNA, herein designated VGAM RNA, to host target binding sites on VGAM598 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM598 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM598 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[8333] It is appreciated that VGAM598 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM598 host target genes. The mRNA of each one of this plurality of VGAM598 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM598 RNA, herein designated VGAM RNA, and which when bound by VGAM598 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM598 host target proteins.

[8334] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM598 gene, herein designated VGAM GENE, on one or more VGAM598 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8335] It is yet further appreciated that a function of VGAM598 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM598 include diagnosis, prevention and treatment of viral infection by Transmissible gastroenteritis virus. Specific functions, and accordingly utilities, of VGAM598 correlate with, and may be deduced from, the identity of the host target genes which VGAM598 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8336] Nucleotide sequences of the VGAM598 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM598 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM598 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM598 are further described hereinbelow with reference to Table 1.

[8337] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM598 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8338] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 599 (VGAM599) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8339] VGAM599 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM599 was detected is described hereinabove with reference to Figs. 2-8.

[8340] VGAM599 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible gastroenteritis virus. VGAM599 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8341] VGAM599 gene, herein designated VGAM GENE, encodes a VGAM599 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM599 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM599 precursor RNA is designated SEQ ID:585, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:585 is located at position 5831 relative to the genome of Transmissible gastroenteritis virus.

[8342] VGAM599 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM599 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8343] An enzyme complex designated DICER COMPLEX, dices the VGAM599 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM599 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM599 RNA is designated SEQ ID:3310, and is provided hereinbelow with reference to the sequence listing part.

[8344] VGAM599 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM599 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM599 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8345] VGAM599 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM599 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM599 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM599 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM599 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8346] The complementary binding of VGAM599 RNA, herein designated VGAM RNA, to host target binding sites on VGAM599 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM599 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM599 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8347] It is appreciated that VGAM599 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM599 host target genes. The mRNA of each one of this plurality of VGAM599 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM599 RNA, herein designated VGAM RNA, and which when bound by VGAM599 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM599 host target proteins.

[8348] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM599 gene, herein designated VGAM GENE, on one or more VGAM599 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8349] It is yet further appreciated that a function of VGAM599 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM599 include diagnosis, prevention and treatment of viral infection by Transmissible gastroenteritis virus. Specific functions, and accordingly utilities, of VGAM599 correlate with, and may be deduced from, the identity of the host target genes which VGAM599 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8350] Nucleotide sequences of the VGAM599 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM599 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM599 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM599 are further described hereinbelow with reference to Table 1.

[8351] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM599 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8352] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 600 (VGAM600) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8353] VGAM600 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM600 was detected is described hereinabove with reference to Figs. 2-8.

[8354] VGAM600 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible gastroenteritis virus. VGAM600 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8355] VGAM600 gene, herein designated VGAM GENE, encodes a

VGAM600 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM600 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM600 precursor RNA is designated SEQ ID:586, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:586 is located at position 5005 relative to the genome of Transmissible gastroenteritis virus.

[8356] VGAM600 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM600 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8357] An enzyme complex designated DICER COMPLEX, dices the VGAM600 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM600 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM600 RNA is designated SEQ ID:3311, and is provided hereinbelow with reference to the sequence listing part.

[8358] VGAM600 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM600 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM600 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8359] VGAM600 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM600 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM600 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM600 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM600 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8360] The complementary binding of VGAM600 RNA, herein designated VGAM RNA, to host target binding sites on VGAM600 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM600 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM600 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8361] It is appreciated that VGAM600 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM600 host target genes. The mRNA of each one of this plurality of VGAM600 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM600 RNA, herein designated VGAM RNA, and which when bound by VGAM600 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM600 host target proteins.

[8362] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM600 gene, herein designated VGAM GENE, on one or more VGAM600 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8363] It is yet further appreciated that a function of VGAM600 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM600 include diagnosis, prevention and treatment of viral infection by Transmissible gastroenteritis virus. Specific functions, and accordingly utilities, of VGAM600 correlate with, and may be deduced from, the identity of the host target genes which VGAM600 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8364] Nucleotide sequences of the VGAM600 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM600 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM600 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM600 are further de-

scribed hereinbelow with reference to Table 1.

[8365] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM600 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8366] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 601 (VGAM601) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8367] VGAM601 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM601 was detected is described hereinabove with reference to Figs. 2-8.

[8368] VGAM601 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible gastroenteritis virus. VGAM601 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8369] VGAM601 gene, herein designated VGAM GENE, encodes a VGAM601 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM601 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM601 precursor RNA is designated SEQ ID:587, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:587 is located at position 10134 relative to the genome of Transmissible gastroenteritis virus.

[8370] VGAM601 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM601 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8371] An enzyme complex designated DICER COMPLEX, dices the VGAM601 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM601 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM601 RNA is designated SEQ ID:3312, and is provided hereinbelow with reference to the sequence listing part.

[8372] VGAM601 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM601 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM601 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8373] VGAM601 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM601 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM601 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM601 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM601 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8374] The complementary binding of VGAM601 RNA, herein designated VGAM RNA, to host target binding sites on VGAM601 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM601 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM601 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8375] It is appreciated that VGAM601 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM601 host target genes. The mRNA of each one of this plurality of VGAM601 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM601 RNA, herein designated VGAM RNA, and which when bound by VGAM601 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM601 host target proteins.

[8376] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM601 gene, herein designated VGAM GENE, on one or more VGAM601 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8377] It is yet further appreciated that a function of VGAM601 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM601 include diagnosis, prevention and treatment of viral infection by Transmissible gastroenteritis virus. Specific functions, and accordingly utilities, of VGAM601 correlate with, and may be deduced from, the identity of the host target genes which VGAM601 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8378] Nucleotide sequences of the VGAM601 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM601 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM601 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM601 are further described hereinbelow with reference to Table 1.

[8379] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM601 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8380] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 602 (VGAM602) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8381] VGAM602 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM602 was detected is described hereinabove with reference to Figs. 2-8.

[8382] VGAM602 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible gastroenteritis virus. VGAM602 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene con-

tained in the human genome.

[8383] VGAM602 gene, herein designated VGAM GENE, encodes a VGAM602 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM602 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM602 precursor RNA is designated SEQ ID:588, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:588 is located at position 10388 relative to the genome of Transmissible gastroenteritis virus.

[8384] VGAM602 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM602 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8385] An enzyme complex designated DICER COMPLEX, dices

the VGAM602 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM602 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 69%) nucleotide sequence of VGAM602 RNA is designated SEQ ID:3313, and is provided hereinbelow with reference to the sequence listing part.

[8386] VGAM602 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM602 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM602 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8387] VGAM602 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM602 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM602 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM602 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM602 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8388] The complementary binding of VGAM602 RNA, herein designated VGAM RNA, to host target binding sites on VGAM602 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM602 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM602 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8389] It is appreciated that VGAM602 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM602 host target genes. The mRNA of each one of this plurality of VGAM602 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM602 RNA, herein designated VGAM RNA, and which when bound by VGAM602 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM602 host target proteins.

[8390] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM602 gene, herein designated VGAM GENE, on one or more VGAM602 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8391] It is yet further appreciated that a function of VGAM602 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM602 include diagnosis, prevention and treatment of viral infection by Transmissible gastroenteritis virus. Specific functions, and accordingly utilities, of VGAM602 correlate with, and may be deduced from, the identity of the host target genes which VGAM602 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8392] Nucleotide sequences of the VGAM602 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM602 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM602 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM602 are further described hereinbelow with reference to Table 1.

[8393] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM602 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8394] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 603 (VGAM603) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8395] VGAM603 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM603 was detected is described hereinabove with reference to Figs. 2-8.

[8396] VGAM603 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible gastroenteritis virus. VGAM603 host target gene, herein desig-

nated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8397] VGAM603 gene, herein designated VGAM GENE, encodes a VGAM603 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM603 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM603 precursor RNA is designated SEQ ID:589, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:589 is located at position 11750 relative to the genome of Transmissible gastroenteritis virus.

[8398] VGAM603 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM603 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8399] An enzyme complex designated DICER COMPLEX, dices the VGAM603 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM603 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM603 RNA is designated SEQ ID:3314, and is provided hereinbelow with reference to the sequence listing part.

[8400] VGAM603 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM603 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM603 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8401] VGAM603 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM603 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM603 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM603 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM603 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8402] The complementary binding of VGAM603 RNA, herein designated VGAM RNA, to host target binding sites on VGAM603 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM603 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM603 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8403] It is appreciated that VGAM603 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM603 host target genes. The mRNA of each one of this plurality of VGAM603 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM603 RNA, herein designated VGAM RNA, and which when bound by VGAM603 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM603 host target proteins.

[8404] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM603 gene, herein designated VGAM GENE, on one or more VGAM603 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8405] It is yet further appreciated that a function of VGAM603 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM603 include diagnosis, prevention and treatment of viral infection by Transmissible gastroenteritis virus. Specific functions, and accordingly utilities, of VGAM603 correlate with, and may be deduced from, the identity of the host target genes which VGAM603 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8406] Nucleotide sequences of the VGAM603 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM603 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM603 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM603 are further described hereinbelow with reference to Table 1.

[8407] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM603 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8408] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 604 (VGAM604) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8409] VGAM604 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM604 was detected is described hereinabove with reference to Figs. 2-8.

[8410] VGAM604 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible gastroen-

teritis virus. VGAM604 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8411] VGAM604 gene, herein designated VGAM GENE, encodes a VGAM604 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM604 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM604 precursor RNA is designated SEQ ID:590, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:590 is located at position 9039 relative to the genome of Transmissible gastroenteritis virus.

[8412] VGAM604 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM604 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

- [8413] An enzyme complex designated DICER COMPLEX, dices the VGAM604 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM604 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM604 RNA is designated SEQ ID:3315, and is provided hereinbelow with reference to the sequence listing part.
- [8414] VGAM604 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM604 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM604 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [8415] VGAM604 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM604 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM604 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM604 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM604 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8416] The complementary binding of VGAM604 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM604 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM604 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM604 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8417] It is appreciated that VGAM604 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM604 host target genes. The mRNA of each one of this plurality of VGAM604 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM604 RNA, herein designated VGAM RNA, and which when bound by VGAM604 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM604 host target proteins.

[8418] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM604 gene, herein designated VGAM GENE, on one or more VGAM604 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8419] It is yet further appreciated that a function of VGAM604 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM604 include diagnosis, prevention and treatment of viral infection by Transmissible gastroenteritis virus. Specific functions, and accordingly utilities, of VGAM604 correlate with, and may be deduced from, the identity of the host target genes which VGAM604 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8420] Nucleotide sequences of the VGAM604 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM604 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM604 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM604 are further described hereinbelow with reference to Table 1.

[8421] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM604 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8422] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 605 (VGAM605) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8423] VGAM605 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM605 was detected is described hereinabove with reference to Figs. 2-8.

[8424] VGAM605 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Transmissible gastroenteritis virus. VGAM605 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8425] VGAM605 gene, herein designated VGAM GENE, encodes a VGAM605 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM605 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM605 precursor RNA is designated SEQ ID:591, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:591 is located at position 4344 relative to the genome of Transmissible gastroenteritis virus.

[8426] VGAM605 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM605 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8427] An enzyme complex designated DICER COMPLEX, dices the VGAM605 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM605 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM605 RNA is designated SEQ ID:3316, and is provided hereinbelow with reference to the sequence listing part.

[8428] VGAM605 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM605 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM605 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8429] VGAM605 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM605 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM605 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM605 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM605 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8430] The complementary binding of VGAM605 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM605 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM605 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM605 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8431] It is appreciated that VGAM605 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM605 host target genes. The mRNA of each one of this plurality of VGAM605 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM605 RNA, herein designated VGAM RNA, and which when bound by VGAM605 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM605 host target proteins.

[8432] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM605 gene, herein designated VGAM GENE, on one or more VGAM605 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8433] It is yet further appreciated that a function of VGAM605 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM605 include diagnosis, prevention and treatment of viral infection by Transmissible gastroenteritis virus. Specific functions, and accordingly utilities, of VGAM605 correlate with, and may be deduced from, the identity of the host target genes which VGAM605 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8434] Nucleotide sequences of the VGAM605 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM605 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM605 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM605 are further described hereinbelow with reference to Table 1.

[8435] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM605 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8436] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 606 (VGAM606) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8437] VGAM606 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM606 was detected is described hereinabove with reference to Figs. 2-8.

[8438] VGAM606 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible gastroenteritis virus. VGAM606 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8439] VGAM606 gene, herein designated VGAM GENE, encodes a VGAM606 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM606 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM606 precursor RNA is designated SEQ ID:592, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:592 is located at position 6033 relative to the genome of Transmissible gastroenteritis virus.

[8440] VGAM606 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM606 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8441] An enzyme complex designated DICER COMPLEX, dices the VGAM606 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM606 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM606 RNA is designated SEQ ID:3317, and is provided hereinbelow with reference to the sequence listing part.

[8442] VGAM606 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM606 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM606 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[8443] VGAM606 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM606 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM606 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM606 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM606 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8444] The complementary binding of VGAM606 RNA, herein designated VGAM RNA, to host target binding sites on VGAM606 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM606 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM606 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8445] It is appreciated that VGAM606 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM606 host target genes. The mRNA of each one of this plurality of VGAM606 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM606 RNA, herein designated VGAM RNA, and which when bound by VGAM606 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM606 host target proteins.

[8446] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM606 gene, herein designated VGAM GENE, on one or

more VGAM606 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8447] It is yet further appreciated that a function of VGAM606 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM606 include diagnosis, prevention and treatment of viral infection by Transmissible gastroenteritis virus. Specific functions, and accordingly utilities, of VGAM606 correlate with, and may be deduced from, the identity of the host target genes which VGAM606 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8448] Nucleotide sequences of the VGAM606 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM606 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM606 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM606 are further described hereinbelow with reference to Table 1.

[8449] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM606 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8450] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 607 (VGAM607) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8451] VGAM607 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM607 was detected is described

hereinabove with reference to Figs. 2–8.

[8452] VGAM607 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice grassy stunt virus. VGAM607 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8453] VGAM607 gene, herein designated VGAM GENE, encodes a VGAM607 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM607 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM607 precursor RNA is designated SEQ ID:593, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:593 is located at position 8963 relative to the genome of Rice grassy stunt virus.

[8454] VGAM607 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM607 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8455] An enzyme complex designated DICER COMPLEX, dices the VGAM607 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM607 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM607 RNA is designated SEQ ID:3318, and is provided hereinbelow with reference to the sequence listing part.

[8456] VGAM607 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM607 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM607 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8457] VGAM607 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM607 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM607 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM607 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM607 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[8458] The complementary binding of VGAM607 RNA, herein designated VGAM RNA, to host target binding sites on VGAM607 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM607 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM607 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8459] It is appreciated that VGAM607 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM607 host target genes. The mRNA of each one of this plurality of VGAM607 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM607 RNA, herein designated VGAM RNA, and which when bound by VGAM607 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM607 host target proteins.

[8460] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM607 gene, herein designated VGAM GENE, on one or more VGAM607 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8461] It is yet further appreciated that a function of VGAM607 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM607 include diagnosis, prevention and treatment of viral infection by Rice grassy stunt virus. Specific functions, and accordingly utilities, of VGAM607 correlate with, and may be deduced from, the identity of the host target genes which VGAM607 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[8462] Nucleotide sequences of the VGAM607 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM607 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM607 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM607 are further described hereinbelow with reference to Table 1.

[8463] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM607 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8464] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 608 (VGAM608) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8465] VGAM608 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM608 was detected is described hereinabove with reference to Figs. 2–8.

[8466] VGAM608 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice grassy stunt virus. VGAM608 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8467] VGAM608 gene, herein designated VGAM GENE, encodes a VGAM608 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM608 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM608 precursor RNA is designated SEQ ID:594, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:594 is located at position 1950 relative to the genome of Rice grassy stunt virus.

[8468] VGAM608 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM608 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8469] An enzyme complex designated DICER COMPLEX, dices the VGAM608 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM608 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM608 RNA is designated SEQ ID:3319, and is provided hereinbelow with reference to the sequence listing part.

[8470] VGAM608 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM608 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM608 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8471] VGAM608 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM608 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM608 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM608 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM608 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8472] The complementary binding of VGAM608 RNA, herein designated VGAM RNA, to host target binding sites on VGAM608 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM608 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM608 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8473] It is appreciated that VGAM608 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM608 host target genes. The mRNA of each one of this plurality of VGAM608 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM608 RNA, herein designated VGAM RNA, and which when bound by VGAM608 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM608 host target proteins.

[8474] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM608 gene, herein designated VGAM GENE, on one or more VGAM608 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8475] It is yet further appreciated that a function of VGAM608 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM608 include diagnosis, prevention and treatment of viral infection by Rice grassy stunt virus. Specific functions, and accordingly utilities, of VGAM608 correlate with, and may be deduced from, the identity of the host target genes which VGAM608 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[8476] Nucleotide sequences of the VGAM608 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM608 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM608 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM608 are further described hereinbelow with reference to Table 1.

[8477] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM608 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8478] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 609 (VGAM609) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8479] VGAM609 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM609 was detected is described hereinabove with reference to Figs. 2–8.

[8480] VGAM609 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice grassy stunt virus. VGAM609 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8481] VGAM609 gene, herein designated VGAM GENE, encodes a VGAM609 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM609 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM609 precursor RNA is designated SEQ ID:595, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:595 is located at position 8205 relative to the genome of Rice grassy stunt virus.

[8482] VGAM609 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM609 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8483] An enzyme complex designated DICER COMPLEX, dices the VGAM609 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM609 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM609 RNA is designated SEQ ID:3320, and is provided hereinbelow with reference to the sequence listing part.

[8484] VGAM609 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM609 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM609 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8485] VGAM609 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM609 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM609 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM609 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM609 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8486] The complementary binding of VGAM609 RNA, herein designated VGAM RNA, to host target binding sites on VGAM609 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM609 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM609 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8487] It is appreciated that VGAM609 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM609 host target genes. The mRNA of each one of this plurality of VGAM609 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM609 RNA, herein designated VGAM RNA, and which when bound by VGAM609 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM609 host target proteins.

[8488] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM609 gene, herein designated VGAM GENE, on one or more VGAM609 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8489] It is yet further appreciated that a function of VGAM609 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM609 include diagnosis, prevention and treatment of viral infection by Rice grassy stunt virus. Specific functions, and accordingly utilities, of VGAM609 correlate with, and may be deduced from, the identity of

the host target genes which VGAM609 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8490] Nucleotide sequences of the VGAM609 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM609 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM609 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM609 are further described hereinbelow with reference to Table 1.

[8491] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM609 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8492] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 610 (VGAM610) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8493] VGAM610 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM610 was detected is described hereinabove with reference to Figs. 2–8.

[8494] VGAM610 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice grassy stunt virus. VGAM610 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8495] VGAM610 gene, herein designated VGAM GENE, encodes a VGAM610 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM610 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM610 precursor RNA is designated SEQ ID:596, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:596 is located at position 4515 relative to the genome of Rice grassy stunt virus.

[8496] VGAM610 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM610 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8497] An enzyme complex designated DICER COMPLEX, dices the VGAM610 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM610 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM610 RNA is designated SEQ ID:3321, and is provided hereinbelow with reference to the sequence listing part.

[8498] VGAM610 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM610 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM610 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8499] VGAM610 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM610 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM610 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM610 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM610 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8500] The complementary binding of VGAM610 RNA, herein designated VGAM RNA, to host target binding sites on VGAM610 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM610 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM610 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8501] It is appreciated that VGAM610 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM610 host target genes. The mRNA of each one of this plurality of VGAM610 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM610 RNA, herein designated VGAM RNA, and which when bound by VGAM610 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM610 host target proteins.

[8502] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM610 gene, herein designated VGAM GENE, on one or more VGAM610 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8503] It is yet further appreciated that a function of VGAM610 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM610 include diagnosis, prevention and treatment of viral infection by Rice grassy stunt virus. Specific functions, and accordingly utilities, of VGAM610

correlate with, and may be deduced from, the identity of the host target genes which VGAM610 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8504] Nucleotide sequences of the VGAM610 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM610 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM610 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM610 are further described hereinbelow with reference to Table 1.

[8505] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM610 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8506] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 611 (VGAM611) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[8507] VGAM611 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM611 was detected is described hereinabove with reference to Figs. 2–8.

[8508] VGAM611 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Xestia c-nigrum granulovirus. VGAM611 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8509] VGAM611 gene, herein designated VGAM GENE, encodes a VGAM611 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM611 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM611 precursor RNA is designated SEQ ID:597, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:597 is located at position 62972 relative to the genome of Xestia c-nigrum granulovirus.

[8510] VGAM611 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM611 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8511] An enzyme complex designated DICER COMPLEX, dices the VGAM611 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM611 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM611 RNA is designated SEQ ID:3322, and is provided hereinbelow with reference to the sequence listing part.

[8512] VGAM611 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM611 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM611 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8513] VGAM611 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM611 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM611 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM611 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM611 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8514] The complementary binding of VGAM611 RNA, herein designated VGAM RNA, to host target binding sites on VGAM611 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM611 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM611 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8515] It is appreciated that VGAM611 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM611 host target genes. The mRNA of each one of this plurality of VGAM611 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM611 RNA, herein designated VGAM RNA, and which when bound by VGAM611 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM611 host target proteins.

[8516] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM611 gene, herein designated VGAM GENE, on one or more VGAM611 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8517] It is yet further appreciated that a function of VGAM611 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM611 include diagnosis, prevention and treatment of viral infection by Xestia c-nigrum gran-

ulovirus. Specific functions, and accordingly utilities, of VGAM611 correlate with, and may be deduced from, the identity of the host target genes which VGAM611 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8518] Nucleotide sequences of the VGAM611 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM611 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM611 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM611 are further described hereinbelow with reference to Table 1.

[8519] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM611 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8520] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 612 (VGAM612) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[8521] VGAM612 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM612 was detected is described hereinabove with reference to Figs. 2–8.

[8522] VGAM612 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Xestia c-nigrum granulovirus. VGAM612 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8523] VGAM612 gene, herein designated VGAM GENE, encodes a VGAM612 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM612 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM612 precursor RNA is designated SEQ ID:598, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:598 is located at position 72787 relative to the genome of Xestia c-nigrum granulovirus.

[8524] VGAM612 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM612 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8525] An enzyme complex designated DICER COMPLEX, dices the VGAM612 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM612 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM612 RNA is designated SEQ ID:3323, and is provided hereinbelow with reference to the sequence listing part.

[8526] VGAM612 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM612 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM612 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8527] VGAM612 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM612 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM612 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM612 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM612 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8528] The complementary binding of VGAM612 RNA, herein designated VGAM RNA, to host target binding sites on VGAM612 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM612 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM612 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8529] It is appreciated that VGAM612 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM612 host target genes. The mRNA of each one of this plurality of VGAM612 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM612 RNA, herein designated VGAM RNA, and which when bound by VGAM612 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM612 host target proteins.

[8530] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM612 gene, herein designated VGAM GENE, on one or more VGAM612 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8531] It is yet further appreciated that a function of VGAM612 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM612 include diagnosis, prevention and

treatment of viral infection by Xestia c-nigrum granulovirus. Specific functions, and accordingly utilities, of VGAM612 correlate with, and may be deduced from, the identity of the host target genes which VGAM612 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8532] Nucleotide sequences of the VGAM612 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM612 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM612 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM612 are further described hereinbelow with reference to Table 1.

[8533] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM612 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8534] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 613 (VGAM613) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8535] VGAM613 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM613 was detected is described hereinabove with reference to Figs. 2–8.

[8536] VGAM613 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Xestia c-nigrum granulovirus. VGAM613 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8537] VGAM613 gene, herein designated VGAM GENE, encodes a VGAM613 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM613 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM613 precursor RNA is designated SEQ ID:599, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:599 is located at position 74562 relative to the genome of Xestia c-nigrum granulovirus.

[8538] VGAM613 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM613 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8539] An enzyme complex designated DICER COMPLEX, dices the VGAM613 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM613 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM613 RNA is designated SEQ ID:3324, and is provided hereinbelow with reference to the sequence listing part.

[8540] VGAM613 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM613 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM613 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8541] VGAM613 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM613 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM613 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM613 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM613 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8542] The complementary binding of VGAM613 RNA, herein designated VGAM RNA, to host target binding sites on VGAM613 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM613 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM613 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8543] It is appreciated that VGAM613 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM613 host target genes. The mRNA of each one of this plurality of VGAM613 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM613 RNA, herein designated VGAM

RNA, and which when bound by VGAM613 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM613 host target proteins.

[8544] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM613 gene, herein designated VGAM GENE, on one or more VGAM613 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8545] It is yet further appreciated that a function of VGAM613 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM613 include diagnosis, prevention and treatment of viral infection by Xestia c-nigrum granulovirus. Specific functions, and accordingly utilities, of VGAM613 correlate with, and may be deduced from, the identity of the host target genes which VGAM613 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8546] Nucleotide sequences of the VGAM613 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM613 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM613 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM613 are further described hereinbelow with reference to Table 1.

[8547] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM613 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8548] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 614 (VGAM614) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8549] VGAM614 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM614 was detected is described hereinabove with reference to Figs. 2–8.

[8550] VGAM614 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Xestia c-nigrum granulovirus. VGAM614 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8551] VGAM614 gene, herein designated VGAM GENE, encodes a VGAM614 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM614 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM614 precursor RNA is designated SEQ ID:600, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:600 is located at position 74778 relative to

the genome of Xestia c-nigrum granulovirus.

[8552] VGAM614 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM614 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8553] An enzyme complex designated DICER COMPLEX, dices the VGAM614 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM614 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM614 RNA is designated SEQ ID:3325, and is provided hereinbelow with reference to the sequence listing part.

[8554] VGAM614 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM614 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM614 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8555] VGAM614 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM614 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM614 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM614 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM614 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8556] The complementary binding of VGAM614 RNA, herein designated VGAM RNA, to host target binding sites on VGAM614 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM614 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM614 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8557] It is appreciated that VGAM614 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM614 host target genes. The mRNA of each one of this plurality of VGAM614 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM614 RNA, herein designated VGAM RNA, and which when bound by VGAM614 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM614 host target proteins.

[8558] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM614 gene, herein designated VGAM GENE, on one or more VGAM614 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8559] It is yet further appreciated that a function of VGAM614 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM614 include diagnosis, prevention and treatment of viral infection by Xestia c-nigrum granulovirus. Specific functions, and accordingly utilities, of VGAM614 correlate with, and may be deduced from, the identity of the host target genes which VGAM614 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8560] Nucleotide sequences of the VGAM614 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM614 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM614 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM614 are further described hereinbelow with reference to Table 1.

[8561] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM614 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8562]

[8563] Fig. 1 further provides a conceptual description of a novel

bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 615 (VGAM615) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8564] VGAM615 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM615 was detected is described hereinabove with reference to Figs. 2–8.

[8565] VGAM615 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Xestia c-nigrum granulovirus. VGAM615 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8566] VGAM615 gene, herein designated VGAM GENE, encodes a VGAM615 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM615 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM615 precursor RNA is designated SEQ ID:601, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:601 is located at position 128621 relative to the genome of Xestia c-nigrum granulovirus.

[8567] VGAM615 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM615 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8568] An enzyme complex designated DICER COMPLEX, dices the VGAM615 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM615 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM615 RNA is designated SEQ ID:3326, and is provided hereinbelow with reference to the sequence

listing part.

[8569] VGAM615 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM615 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM615 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8570] VGAM615 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM615 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM615 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM615 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM615 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8571] The complementary binding of VGAM615 RNA, herein designated VGAM RNA, to host target binding sites on VGAM615 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM615 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM615 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8572] It is appreciated that VGAM615 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM615 host target genes. The mRNA of each one of this plurality of VGAM615 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM615 RNA, herein designated VGAM RNA, and which when bound by VGAM615 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM615 host target proteins.

[8573] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM615 gene, herein designated VGAM GENE, on one or more VGAM615 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8574] It is yet further appreciated that a function of VGAM615 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM615 include diagnosis, prevention and treatment of viral infection by Xestia c-nigrum granulovirus. Specific functions, and accordingly utilities, of VGAM615 correlate with, and may be deduced from, the identity of the host target genes which VGAM615 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8575] Nucleotide sequences of the VGAM615 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM615 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM615 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM615 are further described hereinbelow with reference to Table 1.

[8576] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM615 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8577] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 616 (VGAM616) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8578] VGAM616 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM616 was detected is described hereinabove with reference to Figs. 2–8.

[8579] VGAM616 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Xestia c-nigrum granulovirus. VGAM616 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8580] VGAM616 gene, herein designated VGAM GENE, encodes a VGAM616 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM616 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM616 precursor RNA is designated SEQ ID:602, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:602 is located at position 128882 relative to the genome of Xestia c-nigrum granulovirus.

[8581] VGAM616 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM616 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8582] An enzyme complex designated DICER COMPLEX, dices the VGAM616 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM616 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM616 RNA is designated SEQ ID:3327, and

is provided hereinbelow with reference to the sequence listing part.

[8583] VGAM616 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM616 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM616 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8584] VGAM616 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM616 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM616 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM616 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM616 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8585] The complementary binding of VGAM616 RNA, herein designated VGAM RNA, to host target binding sites on VGAM616 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM616 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM616 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8586] It is appreciated that VGAM616 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM616 host target genes. The mRNA of each one of this plurality of VGAM616 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM616 RNA, herein designated VGAM RNA, and which when bound by VGAM616 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM616 host target proteins.

[8587] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM616 gene, herein designated VGAM GENE, on one or more VGAM616 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8588] It is yet further appreciated that a function of VGAM616 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM616 include diagnosis, prevention and treatment of viral infection by Xestia c-nigrum granulovirus. Specific functions, and accordingly utilities, of VGAM616 correlate with, and may be deduced from, the identity of the host target genes which VGAM616 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8589] Nucleotide sequences of the VGAM616 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM616 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM616 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM616 are further described hereinbelow with reference to Table 1.

[8590] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM616 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8591] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 617 (VGAM617) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8592] VGAM617 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM617 was detected is described hereinabove with reference to Figs. 2–8.

[8593] VGAM617 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Xestia c-nigrum granulovirus. VGAM617 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8594] VGAM617 gene, herein designated VGAM GENE, encodes a VGAM617 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM617 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM617 precursor RNA is

designated SEQ ID:603, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:603 is located at position 140057 relative to the genome of Xestia c-nigrum granulovirus.

[8595] VGAM617 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM617 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8596] An enzyme complex designated DICER COMPLEX, dices the VGAM617 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM617 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide se-

quence of VGAM617 RNA is designated SEQ ID:3328, and is provided hereinbelow with reference to the sequence listing part.

[8597] VGAM617 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM617 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM617 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8598] VGAM617 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM617 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM617 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM617 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM617 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8599] The complementary binding of VGAM617 RNA, herein designated VGAM RNA, to host target binding sites on VGAM617 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM617 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM617 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8600] It is appreciated that VGAM617 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM617 host target genes. The mRNA of

each one of this plurality of VGAM617 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM617 RNA, herein designated VGAM RNA, and which when bound by VGAM617 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM617 host target proteins.

[8601] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM617 gene, herein designated VGAM GENE, on one or more VGAM617 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[8602] It is yet further appreciated that a function of VGAM617 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM617 include diagnosis, prevention and treatment of viral infection by Xestia c-nigrum granulovirus. Specific functions, and accordingly utilities, of VGAM617 correlate with, and may be deduced from, the identity of the host target genes which VGAM617 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8603] Nucleotide sequences of the VGAM617 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM617 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM617 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM617 are further described hereinbelow with reference to Table 1.

[8604] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM617 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[8605] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 618 (VGAM618) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8606] VGAM618 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM618 was detected is described hereinabove with reference to Figs. 2–8.

[8607] VGAM618 gene, herein designated VGAM GENE, is a viral gene contained in the genome of rabbit oral papillomavirus. VGAM618 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8608] VGAM618 gene, herein designated VGAM GENE, encodes a VGAM618 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM618 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM618 precursor RNA is designated SEQ ID:604, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:604 is located at position 4111 relative to the genome of rabbit oral papillomavirus.

[8609] VGAM618 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM618 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8610] An enzyme complex designated DICER COMPLEX, dices the VGAM618 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM618 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 80%) nucleotide sequence of VGAM618 RNA is designated SEQ ID:3329, and is provided hereinbelow with reference to the sequence listing part.

[8611] VGAM618 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM618 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM618 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8612] VGAM618 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM618 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM618 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM618 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM618 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8613] The complementary binding of VGAM618 RNA, herein designated VGAM RNA, to host target binding sites on VGAM618 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM618 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM618 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8614] It is appreciated that VGAM618 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM618 host target genes. The mRNA of each one of this plurality of VGAM618 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM618 RNA, herein designated VGAM RNA, and which when bound by VGAM618 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM618 host target proteins.

[8615] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM618 gene, herein designated VGAM GENE, on one or more VGAM618 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[8616] It is yet further appreciated that a function of VGAM618 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM618 include diagnosis, prevention and treatment of viral infection by rabbit oral papillomavirus. Specific functions, and accordingly utilities, of VGAM618 correlate with, and may be deduced from, the identity of the host target genes which VGAM618 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8617] Nucleotide sequences of the VGAM618 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM618 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM618 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM618 are further described hereinbelow with reference to Table 1.

[8618] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM618 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8619] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 619 (VGAM619) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8620] VGAM619 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM619 was detected is described hereinabove with reference to Figs. 2–8.

[8621] VGAM619 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB virus C. VGAM619 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8622] VGAM619 gene, herein designated VGAM GENE, encodes a VGAM619 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM619 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM619 precursor RNA is designated SEQ ID:605, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:605 is located at position 8778 relative to the genome of Hepatitis GB virus C.

[8623] VGAM619 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM619 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8624] An enzyme complex designated DICER COMPLEX, dices the VGAM619 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM619 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM619 RNA is designated SEQ ID:3330, and is provided hereinbelow with reference to the sequence listing part.

[8625] VGAM619 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM619 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM619 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8626] VGAM619 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM619 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM619 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM619 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM619 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8627] The complementary binding of VGAM619 RNA, herein designated VGAM RNA, to host target binding sites on VGAM619 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM619 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM619 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8628] It is appreciated that VGAM619 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM619 host target genes. The mRNA of each one of this plurality of VGAM619 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM619 RNA, herein designated VGAM RNA, and which when bound by VGAM619 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM619 host target proteins.

[8629] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM619 gene, herein designated VGAM GENE, on one or more VGAM619 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8630] It is yet further appreciated that a function of VGAM619 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM619 include diagnosis, prevention and treatment of viral infection by Hepatitis GB virus C. Specific functions, and accordingly utilities, of VGAM619 correlate with, and may be deduced from, the identity of the host target genes which VGAM619 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8631] Nucleotide sequences of the VGAM619 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM619 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM619 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM619 are further described hereinbelow with reference to Table 1.

[8632] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM619 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8633] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 620 (VGAM620) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8634] VGAM620 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM620 was detected is described hereinabove with reference to Figs. 2–8.

[8635] VGAM620 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB virus C. VGAM620 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8636] VGAM620 gene, herein designated VGAM GENE, encodes a VGAM620 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM620 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM620 precursor RNA is designated SEQ ID:606, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:606 is located at position 3307 relative to the genome of Hepatitis GB virus C.

[8637] VGAM620 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM620 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8638] An enzyme complex designated DICER COMPLEX, dices the VGAM620 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM620 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM620 RNA is designated SEQ ID:3331, and is provided hereinbelow with reference to the sequence listing part.

[8639] VGAM620 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM620 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM620 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8640] VGAM620 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM620 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM620 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM620 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM620 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8641] The complementary binding of VGAM620 RNA, herein designated VGAM RNA, to host target binding sites on VGAM620 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM620 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM620 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8642] It is appreciated that VGAM620 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM620 host target genes. The mRNA of each one of this plurality of VGAM620 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM620 RNA, herein designated VGAM RNA, and which when bound by VGAM620 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM620 host target proteins.

[8643] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM620 gene, herein designated VGAM GENE, on one or more VGAM620 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8644] It is yet further appreciated that a function of VGAM620 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM620 include diagnosis, prevention and treatment of viral infection by Hepatitis GB virus C. Specific functions, and accordingly utilities, of VGAM620 correlate with, and may be deduced from, the identity of the host target genes which VGAM620 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8645] Nucleotide sequences of the VGAM620 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM620 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM620 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM620 are further described hereinbelow with reference to Table 1.

[8646] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM620 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8647] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 621 (VGAM621) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8648] VGAM621 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM621 was detected is described hereinabove with reference to Figs. 2–8.

[8649] VGAM621 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB virus C. VGAM621 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8650] VGAM621 gene, herein designated VGAM GENE, encodes a VGAM621 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM621 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM621 precursor RNA is designated SEQ ID:607, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:607 is located at position 757 relative to the genome of Hepatitis GB virus C.

[8651] VGAM621 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM621 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8652] An enzyme complex designated DICER COMPLEX, dices the VGAM621 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM621 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM621 RNA is designated SEQ ID:3332, and is provided hereinbelow with reference to the sequence listing part.

[8653] VGAM621 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM621 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM621 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8654] VGAM621 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM621 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM621 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM621 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM621 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8655] The complementary binding of VGAM621 RNA, herein designated VGAM RNA, to host target binding sites on VGAM621 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM621 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM621 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[8656] It is appreciated that VGAM621 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM621 host target genes. The mRNA of each one of this plurality of VGAM621 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM621 RNA, herein designated VGAM RNA, and which when bound by VGAM621 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM621 host target proteins.

[8657] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM621 gene, herein designated VGAM GENE, on one or more VGAM621 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8658] It is yet further appreciated that a function of VGAM621 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM621 include diagnosis, prevention and treatment of viral infection by Hepatitis GB virus C. Specific functions, and accordingly utilities, of VGAM621 correlate with, and may be deduced from, the identity of the host target genes which VGAM621 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8659] Nucleotide sequences of the VGAM621 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dliced VGAM621 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM621 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM621 are further described hereinbelow with reference to Table 1.

[8660] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM621 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8661] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 622 (VGAM622) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8662] VGAM622 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM622 was detected is described hereinabove with reference to Figs. 2-8.

[8663] VGAM622 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB virus C. VGAM622 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8664] VGAM622 gene, herein designated VGAM GENE, encodes a VGAM622 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM622 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM622 precursor RNA is designated SEQ ID:608, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:608 is located at position 6041 relative to the genome of Hepatitis GB virus C.

[8665] VGAM622 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM622 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8666] An enzyme complex designated DICER COMPLEX, dices the VGAM622 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM622 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM622 RNA is designated SEQ ID:3333, and is provided hereinbelow with reference to the sequence listing part.

[8667] VGAM622 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM622 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM622 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8668] VGAM622 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM622 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM622 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM622 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM622 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8669] The complementary binding of VGAM622 RNA, herein designated VGAM RNA, to host target binding sites on VGAM622 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM622 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM622 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8670] It is appreciated that VGAM622 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM622 host target genes. The mRNA of each one of this plurality of VGAM622 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM622 RNA, herein designated VGAM RNA, and which when bound by VGAM622 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM622 host target proteins.

[8671] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM622 gene, herein designated VGAM GENE, on one or more VGAM622 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8672] It is yet further appreciated that a function of VGAM622 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM622 include diagnosis, prevention and treatment of viral infection by Hepatitis GB virus C. Specific functions, and accordingly utilities, of VGAM622 correlate with, and may be deduced from, the identity of the host target genes which VGAM622 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8673] Nucleotide sequences of the VGAM622 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM622 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM622 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM622 are further described hereinbelow with reference to Table 1.

[8674] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM622 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8675] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 623 (VGAM623) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8676] VGAM623 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM623 was detected is described hereinabove with reference to Figs. 2-8.

[8677] VGAM623 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB virus C. VGAM623 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8678] VGAM623 gene, herein designated VGAM GENE, encodes a

VGAM623 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM623 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM623 precursor RNA is designated SEQ ID:609, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:609 is located at position 1610 relative to the genome of Hepatitis GB virus C.

[8679] VGAM623 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM623 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8680] An enzyme complex designated DICER COMPLEX, dices the VGAM623 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM623 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM623 RNA is designated SEQ ID:3334, and is provided hereinbelow with reference to the sequence listing part.

[8681] VGAM623 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM623 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM623 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8682] VGAM623 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM623 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM623 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM623 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM623 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8683] The complementary binding of VGAM623 RNA, herein designated VGAM RNA, to host target binding sites on VGAM623 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM623 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM623 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8684] It is appreciated that VGAM623 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM623 host target genes. The mRNA of each one of this plurality of VGAM623 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM623 RNA, herein designated VGAM RNA, and which when bound by VGAM623 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM623 host target proteins.

[8685] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM623 gene, herein designated VGAM GENE, on one or more VGAM623 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8686] It is yet further appreciated that a function of VGAM623 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM623 include diagnosis, prevention and treatment of viral infection by Hepatitis GB virus C. Specific functions, and accordingly utilities, of VGAM623 correlate with, and may be deduced from, the identity of the host target genes which VGAM623 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8687] Nucleotide sequences of the VGAM623 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM623 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM623 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM623 are further de-

scribed hereinbelow with reference to Table 1.

[8688] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM623 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8689] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 624 (VGAM624) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8690] VGAM624 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM624 was detected is described hereinabove with reference to Figs. 2-8.

[8691] VGAM624 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB virus C. VGAM624 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8692] VGAM624 gene, herein designated VGAM GENE, encodes a VGAM624 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM624 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM624 precursor RNA is designated SEQ ID:610, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:610 is located at position 4971 relative to the genome of Hepatitis GB virus C.

[8693] VGAM624 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM624 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8694] An enzyme complex designated DICER COMPLEX, dices the VGAM624 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM624 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM624 RNA is designated SEQ ID:3335, and is provided hereinbelow with reference to the sequence listing part.

[8695] VGAM624 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM624 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM624 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8696] VGAM624 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM624 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM624 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM624 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM624 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8697] The complementary binding of VGAM624 RNA, herein designated VGAM RNA, to host target binding sites on VGAM624 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM624 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM624 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8698] It is appreciated that VGAM624 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM624 host target genes. The mRNA of each one of this plurality of VGAM624 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM624 RNA, herein designated VGAM RNA, and which when bound by VGAM624 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM624 host target proteins.

[8699] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM624 gene, herein designated VGAM GENE, on one or more VGAM624 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8700] It is yet further appreciated that a function of VGAM624 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM624 include diagnosis, prevention and treatment of viral infection by Hepatitis GB virus C. Specific functions, and accordingly utilities, of VGAM624 correlate with, and may be deduced from, the identity of the host target genes which VGAM624 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8701] Nucleotide sequences of the VGAM624 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM624 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM624 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM624 are further described hereinbelow with reference to Table 1.

[8702] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM624 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8703] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 625 (VGAM625) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8704] VGAM625 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM625 was detected is described hereinabove with reference to Figs. 2-8.

[8705] VGAM625 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB virus C. VGAM625 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[8706] VGAM625 gene, herein designated VGAM GENE, encodes a VGAM625 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM625 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM625 precursor RNA is designated SEQ ID:611, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:611 is located at position 6632 relative to the genome of Hepatitis GB virus C.

[8707] VGAM625 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM625 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8708] An enzyme complex designated DICER COMPLEX, dices

the VGAM625 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM625 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM625 RNA is designated SEQ ID:3336, and is provided hereinbelow with reference to the sequence listing part.

[8709] VGAM625 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM625 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM625 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8710] VGAM625 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM625 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM625 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM625 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM625 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8711] The complementary binding of VGAM625 RNA, herein designated VGAM RNA, to host target binding sites on VGAM625 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM625 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM625 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8712] It is appreciated that VGAM625 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM625 host target genes. The mRNA of each one of this plurality of VGAM625 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM625 RNA, herein designated VGAM RNA, and which when bound by VGAM625 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM625 host target proteins.

[8713] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM625 gene, herein designated VGAM GENE, on one or more VGAM625 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8714] It is yet further appreciated that a function of VGAM625 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM625 include diagnosis, prevention and treatment of viral infection by Hepatitis GB virus C. Specific functions, and accordingly utilities, of VGAM625 correlate with, and may be deduced from, the identity of the host target genes which VGAM625 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8715] Nucleotide sequences of the VGAM625 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM625 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM625 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM625 are further described hereinbelow with reference to Table 1.

[8716] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM625 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8717] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 626 (VGAM626) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8718] VGAM626 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM626 was detected is described hereinabove with reference to Figs. 2-8.

[8719] VGAM626 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB virus C. VGAM626 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[8720] VGAM626 gene, herein designated VGAM GENE, encodes a VGAM626 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM626 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM626 precursor RNA is designated SEQ ID:612, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:612 is located at position 1889 relative to the genome of Hepatitis GB virus C.

[8721] VGAM626 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM626 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8722] An enzyme complex designated DICER COMPLEX, dices the VGAM626 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM626 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM626 RNA is designated SEQ ID:3337, and is provided hereinbelow with reference to the sequence listing part.

[8723] VGAM626 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM626 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM626 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8724] VGAM626 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM626 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM626 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM626 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM626 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8725] The complementary binding of VGAM626 RNA, herein designated VGAM RNA, to host target binding sites on VGAM626 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM626 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM626 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8726] It is appreciated that VGAM626 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM626 host target genes. The mRNA of each one of this plurality of VGAM626 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM626 RNA, herein designated VGAM RNA, and which when bound by VGAM626 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM626 host target proteins.

[8727] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM626 gene, herein designated VGAM GENE, on one or more VGAM626 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8728] It is yet further appreciated that a function of VGAM626 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM626 include diagnosis, prevention and treatment of viral infection by Hepatitis GB virus C. Specific functions, and accordingly utilities, of VGAM626 correlate with, and may be deduced from, the identity of the host target genes which VGAM626 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8729] Nucleotide sequences of the VGAM626 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM626 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM626 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM626 are further described hereinbelow with reference to Table 1.

[8730] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM626 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8731] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 627 (VGAM627) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8732] VGAM627 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM627 was detected is described hereinabove with reference to Figs. 2-8.

[8733] VGAM627 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB virus C.

VGAM627 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8734] VGAM627 gene, herein designated VGAM GENE, encodes a VGAM627 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM627 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM627 precursor RNA is designated SEQ ID:613, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:613 is located at position 1443 relative to the genome of Hepatitis GB virus C.

[8735] VGAM627 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM627 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[8736] An enzyme complex designated DICER COMPLEX, dices the VGAM627 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM627 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM627 RNA is designated SEQ ID:3338, and is provided hereinbelow with reference to the sequence listing part.

[8737] VGAM627 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM627 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM627 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8738] VGAM627 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM627 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM627 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM627 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM627 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8739] The complementary binding of VGAM627 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM627 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM627 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM627 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8740] It is appreciated that VGAM627 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM627 host target genes. The mRNA of each one of this plurality of VGAM627 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM627 RNA, herein designated VGAM RNA, and which when bound by VGAM627 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM627 host target proteins.

[8741] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM627 gene, herein designated VGAM GENE, on one or more VGAM627 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8742] It is yet further appreciated that a function of VGAM627 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM627 include diagnosis, prevention and treatment of viral infection by Hepatitis GB virus C. Specific functions, and accordingly utilities, of VGAM627 correlate with, and may be deduced from, the identity of the host target genes which VGAM627 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8743] Nucleotide sequences of the VGAM627 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM627 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM627 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM627 are further described hereinbelow with reference to Table 1.

[8744] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM627 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8745] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 628 (VGAM628) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8746] VGAM628 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM628 was detected is described hereinabove with reference to Figs. 2-8.

[8747] VGAM628 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Hepatitis GB virus C. VGAM628 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8748] VGAM628 gene, herein designated VGAM GENE, encodes a VGAM628 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM628 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM628 precursor RNA is designated SEQ ID:614, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:614 is located at position 3072 relative to the genome of Hepatitis GB virus C.

[8749] VGAM628 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM628 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8750] An enzyme complex designated DICER COMPLEX, dices the VGAM628 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM628 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM628 RNA is designated SEQ ID:3339, and is provided hereinbelow with reference to the sequence listing part.

[8751] VGAM628 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM628 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM628 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8752] VGAM628 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM628 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM628 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM628 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM628 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8753] The complementary binding of VGAM628 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM628 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM628 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM628 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8754] It is appreciated that VGAM628 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM628 host target genes. The mRNA of each one of this plurality of VGAM628 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM628 RNA, herein designated VGAM RNA, and which when bound by VGAM628 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM628 host target proteins.

[8755] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM628 gene, herein designated VGAM GENE, on one or more VGAM628 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8756] It is yet further appreciated that a function of VGAM628 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM628 include diagnosis, prevention and treatment of viral infection by Hepatitis GB virus C. Specific functions, and accordingly utilities, of VGAM628 correlate with, and may be deduced from, the identity of the host target genes which VGAM628 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8757] Nucleotide sequences of the VGAM628 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM628 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM628 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM628 are further described hereinbelow with reference to Table 1.

[8758] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM628 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8759] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 629 (VGAM629) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8760] VGAM629 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM629 was detected is described hereinabove with reference to Figs. 2-8.

[8761] VGAM629 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB virus C. VGAM629 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8762] VGAM629 gene, herein designated VGAM GENE, encodes a VGAM629 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM629 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM629 precursor RNA is designated SEQ ID:615, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:615 is located at position 7116 relative to the genome of Hepatitis GB virus C.

[8763] VGAM629 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM629 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8764] An enzyme complex designated DICER COMPLEX, dices the VGAM629 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM629 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM629 RNA is designated SEQ ID:3340, and is provided hereinbelow with reference to the sequence listing part.

[8765] VGAM629 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM629 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM629 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[8766] VGAM629 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM629 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM629 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM629 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM629 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8767] The complementary binding of VGAM629 RNA, herein designated VGAM RNA, to host target binding sites on VGAM629 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM629 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM629 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8768] It is appreciated that VGAM629 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM629 host target genes. The mRNA of each one of this plurality of VGAM629 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM629 RNA, herein designated VGAM RNA, and which when bound by VGAM629 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM629 host target proteins.

[8769] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM629 gene, herein designated VGAM GENE, on one or

more VGAM629 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8770] It is yet further appreciated that a function of VGAM629 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM629 include diagnosis, prevention and treatment of viral infection by Hepatitis GB virus C. Specific functions, and accordingly utilities, of VGAM629 correlate with, and may be deduced from, the identity of the host target genes which VGAM629 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8771] Nucleotide sequences of the VGAM629 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM629 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM629 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM629 are further described hereinbelow with reference to Table 1.

[8772] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM629 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8773] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 630 (VGAM630) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8774] VGAM630 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM630 was detected is described

hereinabove with reference to Figs. 2–8.

[8775] VGAM630 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB virus C.

VGAM630 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8776] VGAM630 gene, herein designated VGAM GENE, encodes a VGAM630 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM630 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM630 precursor RNA is designated SEQ ID:616, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:616 is located at position 4257 relative to the genome of Hepatitis GB virus C.

[8777] VGAM630 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM630 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8778] An enzyme complex designated DICER COMPLEX, dices the VGAM630 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM630 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM630 RNA is designated SEQ ID:3341, and is provided hereinbelow with reference to the sequence listing part.

[8779] VGAM630 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM630 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM630 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8780] VGAM630 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM630 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM630 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM630 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM630 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[8781] The complementary binding of VGAM630 RNA, herein designated VGAM RNA, to host target binding sites on VGAM630 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM630 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM630 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8782] It is appreciated that VGAM630 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM630 host target genes. The mRNA of each one of this plurality of VGAM630 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM630 RNA, herein designated VGAM RNA, and which when bound by VGAM630 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM630 host target proteins.

[8783] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM630 gene, herein designated VGAM GENE, on one or more VGAM630 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8784] It is yet further appreciated that a function of VGAM630 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM630 include diagnosis, prevention and treatment of viral infection by Hepatitis GB virus C. Specific functions, and accordingly utilities, of VGAM630 correlate with, and may be deduced from, the identity of the host target genes which VGAM630 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[8785] Nucleotide sequences of the VGAM630 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM630 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM630 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM630 are further described hereinbelow with reference to Table 1.

[8786] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM630 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8787] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 631 (VGAM631) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8788] VGAM631 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM631 was detected is described hereinabove with reference to Figs. 2–8.

[8789] VGAM631 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ovine astrovirus.

VGAM631 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8790] VGAM631 gene, herein designated VGAM GENE, encodes a VGAM631 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM631 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM631 precursor RNA is designated SEQ ID:617, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:617 is located at position 1595 relative to the genome of Ovine astrovirus.

[8791] VGAM631 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM631 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8792] An enzyme complex designated DICER COMPLEX, dices the VGAM631 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM631 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM631 RNA is designated SEQ ID:3342, and is provided hereinbelow with reference to the sequence listing part.

[8793] VGAM631 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM631 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM631 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8794] VGAM631 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM631 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM631 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM631 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM631 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8795] The complementary binding of VGAM631 RNA, herein designated VGAM RNA, to host target binding sites on VGAM631 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM631 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM631 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8796] It is appreciated that VGAM631 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM631 host target genes. The mRNA of each one of this plurality of VGAM631 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM631 RNA, herein designated VGAM RNA, and which when bound by VGAM631 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM631 host target proteins.

[8797] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM631 gene, herein designated VGAM GENE, on one or more VGAM631 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8798] It is yet further appreciated that a function of VGAM631 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM631 include diagnosis, prevention and treatment of viral infection by Ovine astrovirus. Specific functions, and accordingly utilities, of VGAM631 correlate with, and may be deduced from, the identity of the host target genes which VGAM631 binds and inhibits, and the

function of these host target genes, as elaborated herein—below.

[8799] Nucleotide sequences of the VGAM631 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM631 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM631 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM631 are further described hereinbelow with reference to Table 1.

[8800] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM631 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8801] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 632 (VGAM632) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8802] VGAM632 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM632 was detected is described hereinabove with reference to Figs. 2–8.

[8803] VGAM632 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ovine astrovirus.

VGAM632 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8804] VGAM632 gene, herein designated VGAM GENE, encodes a VGAM632 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM632 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM632 precursor RNA is designated SEQ ID:618, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:618 is located at position 1405 relative to the genome of Ovine astrovirus.

[8805] VGAM632 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM632 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8806] An enzyme complex designated DICER COMPLEX, dices the VGAM632 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM632 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM632 RNA is designated SEQ ID:3343, and is provided hereinbelow with reference to the sequence listing part.

[8807] VGAM632 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM632 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM632 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8808] VGAM632 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM632 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM632 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM632 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM632 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8809] The complementary binding of VGAM632 RNA, herein designated VGAM RNA, to host target binding sites on VGAM632 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM632 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM632 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8810] It is appreciated that VGAM632 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM632 host target genes. The mRNA of each one of this plurality of VGAM632 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM632 RNA, herein designated VGAM RNA, and which when bound by VGAM632 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM632 host target proteins.

[8811] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM632 gene, herein designated VGAM GENE, on one or more VGAM632 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8812] It is yet further appreciated that a function of VGAM632 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM632 include diagnosis, prevention and treatment of viral infection by Ovine astrovirus. Specific functions, and accordingly utilities, of VGAM632 correlate with, and may be deduced from, the identity of the host

target genes which VGAM632 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8813] Nucleotide sequences of the VGAM632 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM632 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM632 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM632 are further described hereinbelow with reference to Table 1.

[8814] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM632 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8815] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 633 (VGAM633) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8816] VGAM633 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM633 was detected is described hereinabove with reference to Figs. 2–8.

[8817] VGAM633 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Turkey astrovirus. VGAM633 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8818] VGAM633 gene, herein designated VGAM GENE, encodes a VGAM633 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM633 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM633 precursor RNA is designated SEQ ID:619, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:619 is located at position 2114 relative to the genome of Turkey astrovirus.

[8819] VGAM633 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM633 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8820] An enzyme complex designated DICER COMPLEX, dices the VGAM633 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM633 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM633 RNA is designated SEQ ID:3344, and is provided hereinbelow with reference to the sequence listing part.

[8821] VGAM633 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM633 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM633 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8822] VGAM633 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM633 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM633 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM633 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM633 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8823] The complementary binding of VGAM633 RNA, herein designated VGAM RNA, to host target binding sites on VGAM633 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM633 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM633 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8824] It is appreciated that VGAM633 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM633 host target genes. The mRNA of each one of this plurality of VGAM633 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM633 RNA, herein designated VGAM RNA, and which when bound by VGAM633 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM633 host target proteins.

[8825] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM633 gene, herein designated VGAM GENE, on one or more VGAM633 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8826] It is yet further appreciated that a function of VGAM633 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM633 include diagnosis, prevention and treatment of viral infection by Turkey astrovirus. Specific functions, and accordingly utilities, of VGAM633 correlate

with, and may be deduced from, the identity of the host target genes which VGAM633 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8827] Nucleotide sequences of the VGAM633 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM633 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM633 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM633 are further described hereinbelow with reference to Table 1.

[8828] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM633 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8829] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 634 (VGAM634) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[8830] VGAM634 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM634 was detected is described hereinabove with reference to Figs. 2–8.

[8831] VGAM634 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Turkey astrovirus. VGAM634 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8832] VGAM634 gene, herein designated VGAM GENE, encodes a VGAM634 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM634 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM634 precursor RNA is designated SEQ ID:620, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:620 is located at position 1689 relative to the genome of Turkey astrovirus.

[8833] VGAM634 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM634 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8834] An enzyme complex designated DICER COMPLEX, dices the VGAM634 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM634 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM634 RNA is designated SEQ ID:3345, and is provided hereinbelow with reference to the sequence listing part.

[8835] VGAM634 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM634 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM634 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8836] VGAM634 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM634 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM634 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM634 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM634 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8837] The complementary binding of VGAM634 RNA, herein designated VGAM RNA, to host target binding sites on VGAM634 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM634 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM634 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8838] It is appreciated that VGAM634 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM634 host target genes. The mRNA of each one of this plurality of VGAM634 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM634 RNA, herein designated VGAM RNA, and which when bound by VGAM634 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM634 host target proteins.

[8839] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM634 gene, herein designated VGAM GENE, on one or more VGAM634 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8840] It is yet further appreciated that a function of VGAM634 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM634 include diagnosis, prevention and treatment of viral infection by Turkey astrovirus. Specific

functions, and accordingly utilities, of VGAM634 correlate with, and may be deduced from, the identity of the host target genes which VGAM634 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8841] Nucleotide sequences of the VGAM634 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM634 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM634 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM634 are further described hereinbelow with reference to Table 1.

[8842] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM634 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8843] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 635 (VGAM635) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[8844] VGAM635 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM635 was detected is described hereinabove with reference to Figs. 2–8.

[8845] VGAM635 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cherry mottle leaf virus. VGAM635 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8846] VGAM635 gene, herein designated VGAM GENE, encodes a VGAM635 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM635 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM635 precursor RNA is designated SEQ ID:621, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:621 is located at position 457 relative to the genome of Cherry mottle leaf virus.

[8847] VGAM635 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM635 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8848] An enzyme complex designated DICER COMPLEX, dices the VGAM635 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM635 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM635 RNA is designated SEQ ID:3346, and is provided hereinbelow with reference to the sequence listing part.

[8849] VGAM635 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM635 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM635 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8850] VGAM635 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM635 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM635 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM635 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM635 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8851] The complementary binding of VGAM635 RNA, herein designated VGAM RNA, to host target binding sites on VGAM635 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM635 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM635 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8852] It is appreciated that VGAM635 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM635 host target genes. The mRNA of each one of this plurality of VGAM635 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM635 RNA, herein designated VGAM RNA, and which when bound by VGAM635 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM635 host target proteins.

[8853] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM635 gene, herein designated VGAM GENE, on one or more VGAM635 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8854] It is yet further appreciated that a function of VGAM635 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM635 include diagnosis, prevention and

treatment of viral infection by Cherry mottle leaf virus. Specific functions, and accordingly utilities, of VGAM635 correlate with, and may be deduced from, the identity of the host target genes which VGAM635 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8855] Nucleotide sequences of the VGAM635 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM635 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM635 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM635 are further described hereinbelow with reference to Table 1.

[8856] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM635 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8857] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 636 (VGAM636) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8858] VGAM636 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM636 was detected is described hereinabove with reference to Figs. 2–8.

[8859] VGAM636 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cherry mottle leaf virus. VGAM636 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8860] VGAM636 gene, herein designated VGAM GENE, encodes a VGAM636 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM636 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM636 precursor RNA is designated SEQ ID:622, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:622 is located at position 3861 relative to the genome of Cherry mottle leaf virus.

[8861] VGAM636 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM636 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8862] An enzyme complex designated DICER COMPLEX, dices the VGAM636 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM636 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM636 RNA is designated SEQ ID:3347, and is provided hereinbelow with reference to the sequence listing part.

[8863] VGAM636 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM636 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM636 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8864] VGAM636 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM636 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM636 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM636 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM636 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8865] The complementary binding of VGAM636 RNA, herein designated VGAM RNA, to host target binding sites on VGAM636 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM636 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM636 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8866] It is appreciated that VGAM636 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM636 host target genes. The mRNA of each one of this plurality of VGAM636 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM636 RNA, herein designated VGAM

RNA, and which when bound by VGAM636 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM636 host target proteins.

[8867] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM636 gene, herein designated VGAM GENE, on one or more VGAM636 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8868] It is yet further appreciated that a function of VGAM636 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM636 include diagnosis, prevention and treatment of viral infection by Cherry mottle leaf virus. Specific functions, and accordingly utilities, of VGAM636 correlate with, and may be deduced from, the identity of the host target genes which VGAM636 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8869] Nucleotide sequences of the VGAM636 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM636 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM636 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM636 are further described hereinbelow with reference to Table 1.

[8870] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM636 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8871] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 637 (VGAM637) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8872] VGAM637 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM637 was detected is described hereinabove with reference to Figs. 2–8.

[8873] VGAM637 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Frog adenovirus 1. VGAM637 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8874] VGAM637 gene, herein designated VGAM GENE, encodes a VGAM637 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM637 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM637 precursor RNA is designated SEQ ID:623, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:623 is located at position 5382 relative to

the genome of Frog adenovirus 1.

[8875] VGAM637 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM637 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8876] An enzyme complex designated DICER COMPLEX, dices the VGAM637 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM637 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM637 RNA is designated SEQ ID:3348, and is provided hereinbelow with reference to the sequence listing part.

[8877] VGAM637 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM637 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM637 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8878] VGAM637 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM637 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM637 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM637 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM637 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8879] The complementary binding of VGAM637 RNA, herein designated VGAM RNA, to host target binding sites on VGAM637 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM637 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM637 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8880] It is appreciated that VGAM637 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM637 host target genes. The mRNA of each one of this plurality of VGAM637 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM637 RNA, herein designated VGAM RNA, and which when bound by VGAM637 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM637 host target proteins.

[8881] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM637 gene, herein designated VGAM GENE, on one or more VGAM637 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8882] It is yet further appreciated that a function of VGAM637 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM637 include diagnosis, prevention and treatment of viral infection by Frog adenovirus 1. Specific functions, and accordingly utilities, of VGAM637 correlate with, and may be deduced from, the identity of the host target genes which VGAM637 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8883] Nucleotide sequences of the VGAM637 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM637 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM637 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM637 are further described hereinbelow with reference to Table 1.

[8884] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM637 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8885] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 638 (VGAM638) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8886] VGAM638 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM638 was detected is described hereinabove with reference to Figs. 2–8.

[8887] VGAM638 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Turnip mosaic virus. VGAM638 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8888] VGAM638 gene, herein designated VGAM GENE, encodes a VGAM638 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM638 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM638 precursor RNA is designated SEQ ID:624, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:624 is located at position 6990 relative to the genome of Turnip mosaic virus.

[8889] VGAM638 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM638 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8890] An enzyme complex designated DICER COMPLEX, dices the VGAM638 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM638 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM638 RNA is designated SEQ ID:3349, and is provided hereinbelow with reference to the sequence

listing part.

[8891] VGAM638 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM638 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM638 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8892] VGAM638 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM638 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM638 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM638 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM638 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8893] The complementary binding of VGAM638 RNA, herein designated VGAM RNA, to host target binding sites on VGAM638 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM638 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM638 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8894] It is appreciated that VGAM638 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM638 host target genes. The mRNA of each one of this plurality of VGAM638 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM638 RNA, herein designated VGAM RNA, and which when bound by VGAM638 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM638 host target proteins.

[8895] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM638 gene, herein designated VGAM GENE, on one or more VGAM638 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8896] It is yet further appreciated that a function of VGAM638 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM638 include diagnosis, prevention and treatment of viral infection by Turnip mosaic virus. Specific functions, and accordingly utilities, of VGAM638 correlate with, and may be deduced from, the identity of the host target genes which VGAM638 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8897] Nucleotide sequences of the VGAM638 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM638 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM638 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM638 are further described hereinbelow with reference to Table 1.

[8898] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM638 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8899] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 639 (VGAM639) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8900] VGAM639 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM639 was detected is described hereinabove with reference to Figs. 2–8.

[8901] VGAM639 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Turnip mosaic virus. VGAM639 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8902] VGAM639 gene, herein designated VGAM GENE, encodes a VGAM639 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM639 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM639 precursor RNA is designated SEQ ID:625, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:625 is located at position 5030 relative to the genome of Turnip mosaic virus.

[8903] VGAM639 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM639 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8904] An enzyme complex designated DICER COMPLEX, dices the VGAM639 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM639 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM639 RNA is designated SEQ ID:3350, and

is provided hereinbelow with reference to the sequence listing part.

[8905] VGAM639 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM639 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM639 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8906] VGAM639 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM639 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM639 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM639 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM639 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8907] The complementary binding of VGAM639 RNA, herein designated VGAM RNA, to host target binding sites on VGAM639 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM639 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM639 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8908] It is appreciated that VGAM639 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM639 host target genes. The mRNA of each one of this plurality of VGAM639 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM639 RNA, herein designated VGAM RNA, and which when bound by VGAM639 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM639 host target proteins.

[8909] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM639 gene, herein designated VGAM GENE, on one or more VGAM639 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8910] It is yet further appreciated that a function of VGAM639 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM639 include diagnosis, prevention and treatment of viral infection by Turnip mosaic virus. Specific functions, and accordingly utilities, of VGAM639 correlate with, and may be deduced from, the identity of the host target genes which VGAM639 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8911] Nucleotide sequences of the VGAM639 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM639 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM639 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM639 are further described hereinbelow with reference to Table 1.

[8912] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM639 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8913] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 640 (VGAM640) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8914] VGAM640 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM640 was detected is described hereinabove with reference to Figs. 2–8.

[8915] VGAM640 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Turnip mosaic virus. VGAM640 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8916] VGAM640 gene, herein designated VGAM GENE, encodes a VGAM640 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM640 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM640 precursor RNA is

designated SEQ ID:626, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:626 is located at position 9395 relative to the genome of Turnip mosaic virus.

[8917] VGAM640 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM640 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8918] An enzyme complex designated DICER COMPLEX, dices the VGAM640 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM640 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide se-

quence of VGAM640 RNA is designated SEQ ID:3351, and is provided hereinbelow with reference to the sequence listing part.

[8919] VGAM640 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM640 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM640 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8920] VGAM640 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM640 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM640 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM640 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM640 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8921] The complementary binding of VGAM640 RNA, herein designated VGAM RNA, to host target binding sites on VGAM640 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM640 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM640 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8922] It is appreciated that VGAM640 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM640 host target genes. The mRNA of

each one of this plurality of VGAM640 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM640 RNA, herein designated VGAM RNA, and which when bound by VGAM640 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM640 host target proteins.

[8923] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM640 gene, herein designated VGAM GENE, on one or more VGAM640 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[8924] It is yet further appreciated that a function of VGAM640 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM640 include diagnosis, prevention and treatment of viral infection by Turnip mosaic virus. Specific functions, and accordingly utilities, of VGAM640 correlate with, and may be deduced from, the identity of the host target genes which VGAM640 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8925] Nucleotide sequences of the VGAM640 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM640 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM640 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM640 are further described hereinbelow with reference to Table 1.

[8926] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM640 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[8927] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 641 (VGAM641) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8928] VGAM641 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM641 was detected is described hereinabove with reference to Figs. 2–8.

[8929] VGAM641 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM641 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8930] VGAM641 gene, herein designated VGAM GENE, encodes a VGAM641 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM641 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM641 precursor RNA is designated SEQ ID:627, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:627 is located at position 50326 relative to the genome of Rat cytomegalovirus.

[8931] VGAM641 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM641 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8932] An enzyme complex designated DICER COMPLEX, dices the VGAM641 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM641 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 79%) nucleotide sequence of VGAM641 RNA is designated SEQ ID:3352, and is provided hereinbelow with reference to the sequence listing part.

[8933] VGAM641 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM641 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM641 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8934] VGAM641 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM641 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM641 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM641 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM641 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8935] The complementary binding of VGAM641 RNA, herein designated VGAM RNA, to host target binding sites on VGAM641 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM641 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM641 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8936] It is appreciated that VGAM641 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM641 host target genes. The mRNA of each one of this plurality of VGAM641 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM641 RNA, herein designated VGAM RNA, and which when bound by VGAM641 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM641 host target proteins.

[8937] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM641 gene, herein designated VGAM GENE, on one or more VGAM641 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[8938] It is yet further appreciated that a function of VGAM641 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM641 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM641 correlate with, and may be deduced from, the identity of the host target genes which VGAM641 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8939] Nucleotide sequences of the VGAM641 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM641 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM641 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM641 are further described hereinbelow with reference to Table 1.

[8940] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM641 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8941] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 642 (VGAM642) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8942] VGAM642 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM642 was detected is described hereinabove with reference to Figs. 2–8.

[8943] VGAM642 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM642 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8944] VGAM642 gene, herein designated VGAM GENE, encodes a VGAM642 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM642 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM642 precursor RNA is designated SEQ ID:628, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:628 is located at position 96235 relative to the genome of Rat cytomegalovirus.

[8945] VGAM642 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM642 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8946] An enzyme complex designated DICER COMPLEX, dices the VGAM642 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM642 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM642 RNA is designated SEQ ID:3353, and is provided hereinbelow with reference to the sequence listing part.

[8947] VGAM642 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM642 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM642 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8948] VGAM642 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM642 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM642 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM642 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM642 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8949] The complementary binding of VGAM642 RNA, herein designated VGAM RNA, to host target binding sites on VGAM642 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM642 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM642 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8950] It is appreciated that VGAM642 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM642 host target genes. The mRNA of each one of this plurality of VGAM642 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM642 RNA, herein designated VGAM RNA, and which when bound by VGAM642 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM642 host target proteins.

[8951] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM642 gene, herein designated VGAM GENE, on one or more VGAM642 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8952] It is yet further appreciated that a function of VGAM642 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM642 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM642 correlate with, and may be deduced from, the identity of the host target genes which VGAM642 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8953] Nucleotide sequences of the VGAM642 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM642 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM642 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM642 are further described hereinbelow with reference to Table 1.

[8954] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM642 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8955] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 643 (VGAM643) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8956] VGAM643 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM643 was detected is described hereinabove with reference to Figs. 2–8.

[8957] VGAM643 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM643 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8958] VGAM643 gene, herein designated VGAM GENE, encodes a VGAM643 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM643 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM643 precursor RNA is designated SEQ ID:629, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:629 is located at position 112209 relative to the genome of Rat cytomegalovirus.

[8959] VGAM643 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM643 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8960] An enzyme complex designated DICER COMPLEX, dices the VGAM643 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM643 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM643 RNA is designated SEQ ID:3354, and is provided hereinbelow with reference to the sequence listing part.

[8961] VGAM643 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM643 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM643 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8962] VGAM643 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM643 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM643 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM643 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM643 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8963] The complementary binding of VGAM643 RNA, herein designated VGAM RNA, to host target binding sites on VGAM643 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM643 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM643 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8964] It is appreciated that VGAM643 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM643 host target genes. The mRNA of each one of this plurality of VGAM643 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM643 RNA, herein designated VGAM RNA, and which when bound by VGAM643 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM643 host target proteins.

[8965] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM643 gene, herein designated VGAM GENE, on one or more VGAM643 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8966] It is yet further appreciated that a function of VGAM643 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM643 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM643 correlate with, and may be deduced from, the identity of the host target genes which VGAM643 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8967] Nucleotide sequences of the VGAM643 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM643 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM643 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM643 are further described hereinbelow with reference to Table 1.

[8968] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM643 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8969] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 644 (VGAM644) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8970] VGAM644 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM644 was detected is described hereinabove with reference to Figs. 2–8.

[8971] VGAM644 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parvovirus H1. VGAM644 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8972] VGAM644 gene, herein designated VGAM GENE, encodes a VGAM644 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM644 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM644 precursor RNA is designated SEQ ID:630, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:630 is located at position 129 relative to the genome of Parvovirus H1.

[8973] VGAM644 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM644 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8974] An enzyme complex designated DICER COMPLEX, dices the VGAM644 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM644 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM644 RNA is designated SEQ ID:3355, and is provided hereinbelow with reference to the sequence listing part.

[8975] VGAM644 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM644 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM644 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8976] VGAM644 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM644 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM644 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM644 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM644 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8977] The complementary binding of VGAM644 RNA, herein designated VGAM RNA, to host target binding sites on VGAM644 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM644 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM644 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8978] It is appreciated that VGAM644 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM644 host target genes. The mRNA of each one of this plurality of VGAM644 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM644 RNA, herein designated VGAM RNA, and which when bound by VGAM644 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM644 host target proteins.

[8979] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM644 gene, herein designated VGAM GENE, on one or more VGAM644 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8980] It is yet further appreciated that a function of VGAM644 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM644 include diagnosis, prevention and treatment of viral infection by Parvovirus H1. Specific functions, and accordingly utilities, of VGAM644 correlate with, and may be deduced from, the identity of the host target genes which VGAM644 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8981] Nucleotide sequences of the VGAM644 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM644 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM644 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM644 are further described hereinbelow with reference to Table 1.

[8982] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM644 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8983] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 645 (VGAM645) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8984] VGAM645 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM645 was detected is described hereinabove with reference to Figs. 2–8.

[8985] VGAM645 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parvovirus H1. VGAM645 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8986] VGAM645 gene, herein designated VGAM GENE, encodes a VGAM645 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM645 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM645 precursor RNA is designated SEQ ID:631, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:631 is located at position 1 relative to the genome of Parvovirus H1.

[8987] VGAM645 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM645 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8988] An enzyme complex designated DICER COMPLEX, dices the VGAM645 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM645 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM645 RNA is designated SEQ ID:3356, and is provided hereinbelow with reference to the sequence listing part.

[8989] VGAM645 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM645 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM645 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[8990] VGAM645 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM645 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM645 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM645 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM645 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[8991] The complementary binding of VGAM645 RNA, herein designated VGAM RNA, to host target binding sites on VGAM645 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM645 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM645 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8992] It is appreciated that VGAM645 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM645 host target genes. The mRNA of each one of this plurality of VGAM645 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM645 RNA, herein designated VGAM RNA, and which when bound by VGAM645 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM645 host target proteins.

[8993] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM645 gene, herein designated VGAM GENE, on one or more VGAM645 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[8994] It is yet further appreciated that a function of VGAM645 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM645 include diagnosis, prevention and treatment of viral infection by Parvovirus H1. Specific functions, and accordingly utilities, of VGAM645 correlate with, and may be deduced from, the identity of the host target genes which VGAM645 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8995] Nucleotide sequences of the VGAM645 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM645 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM645 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM645 are further described hereinbelow with reference to Table 1.

[8996] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM645 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8997] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 646 (VGAM646) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8998] VGAM646 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM646 was detected is described hereinabove with reference to Figs. 2–8.

[8999] VGAM646 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lactate dehydrogenase-elevating virus. VGAM646 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9000] VGAM646 gene, herein designated VGAM GENE, encodes a VGAM646 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM646 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM646 precursor RNA is designated SEQ ID:632, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:632 is located at position 1908 relative to the genome of Lactate dehydrogenase-elevating virus.

[9001] VGAM646 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM646 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9002] An enzyme complex designated DICER COMPLEX, dices the VGAM646 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM646 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM646 RNA is designated SEQ ID:3357, and is provided hereinbelow with reference to the sequence listing part.

[9003] VGAM646 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM646 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM646 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9004] VGAM646 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM646 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM646 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM646 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM646 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9005] The complementary binding of VGAM646 RNA, herein designated VGAM RNA, to host target binding sites on VGAM646 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM646 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM646 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[9006] It is appreciated that VGAM646 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM646 host target genes. The mRNA of each one of this plurality of VGAM646 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM646 RNA, herein designated VGAM RNA, and which when bound by VGAM646 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM646 host target proteins.

[9007] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM646 gene, herein designated VGAM GENE, on one or more VGAM646 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9008] It is yet further appreciated that a function of VGAM646 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM646 include diagnosis, prevention and treatment of viral infection by Lactate dehydrogenase-elevating virus. Specific functions, and accordingly utilities, of VGAM646 correlate with, and may be deduced from, the identity of the host target genes which VGAM646 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9009] Nucleotide sequences of the VGAM646 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM646 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM646 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM646 are further described hereinbelow with reference to Table 1.

[9010] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM646 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9011] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 647 (VGAM647) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9012] VGAM647 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM647 was detected is described hereinabove with reference to Figs. 2-8.

[9013] VGAM647 gene, herein designated VGAM GENE, is a viral gene contained in the genome of acute bee paralysis virus. VGAM647 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9014] VGAM647 gene, herein designated VGAM GENE, encodes a VGAM647 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM647 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM647 precursor RNA is designated SEQ ID:633, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:633 is located at position 5839 relative to the genome of acute bee paralysis virus.

[9015] VGAM647 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM647 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9016] An enzyme complex designated DICER COMPLEX, dices the VGAM647 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM647 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM647 RNA is designated SEQ ID:3358, and is provided hereinbelow with reference to the sequence listing part.

[9017] VGAM647 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM647 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM647 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9018] VGAM647 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM647 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM647 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM647 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM647 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9019] The complementary binding of VGAM647 RNA, herein designated VGAM RNA, to host target binding sites on VGAM647 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM647 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM647 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9020] It is appreciated that VGAM647 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM647 host target genes. The mRNA of each one of this plurality of VGAM647 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM647 RNA, herein designated VGAM RNA, and which when bound by VGAM647 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM647 host target proteins.

[9021] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM647 gene, herein designated VGAM GENE, on one or more VGAM647 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9022] It is yet further appreciated that a function of VGAM647 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM647 include diagnosis, prevention and treatment of viral infection by acute bee paralysis virus. Specific functions, and accordingly utilities, of VGAM647 correlate with, and may be deduced from, the identity of the host target genes which VGAM647 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9023] Nucleotide sequences of the VGAM647 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM647 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM647 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM647 are further described hereinbelow with reference to Table 1.

[9024] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM647 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9025] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 648 (VGAM648) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9026] VGAM648 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM648 was detected is described hereinabove with reference to Figs. 2-8.

[9027] VGAM648 gene, herein designated VGAM GENE, is a viral gene contained in the genome of acute bee paralysis virus. VGAM648 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9028] VGAM648 gene, herein designated VGAM GENE, encodes a

VGAM648 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM648 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM648 precursor RNA is designated SEQ ID:634, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:634 is located at position 5074 relative to the genome of acute bee paralysis virus.

[9029] VGAM648 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM648 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9030] An enzyme complex designated DICER COMPLEX, dices the VGAM648 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM648 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM648 RNA is designated SEQ ID:3359, and is provided hereinbelow with reference to the sequence listing part.

[9031] VGAM648 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM648 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM648 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9032] VGAM648 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM648 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM648 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM648 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM648 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9033] The complementary binding of VGAM648 RNA, herein designated VGAM RNA, to host target binding sites on VGAM648 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM648 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM648 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9034] It is appreciated that VGAM648 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM648 host target genes. The mRNA of each one of this plurality of VGAM648 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM648 RNA, herein designated VGAM RNA, and which when bound by VGAM648 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM648 host target proteins.

[9035] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM648 gene, herein designated VGAM GENE, on one or more VGAM648 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9036] It is yet further appreciated that a function of VGAM648 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM648 include diagnosis, prevention and treatment of viral infection by acute bee paralysis virus. Specific functions, and accordingly utilities, of VGAM648 correlate with, and may be deduced from, the identity of the host target genes which VGAM648 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9037] Nucleotide sequences of the VGAM648 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM648 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM648 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM648 are further de-

scribed hereinbelow with reference to Table 1.

[9038] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM648 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9039] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 649 (VGAM649) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9040] VGAM649 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM649 was detected is described hereinabove with reference to Figs. 2-8.

[9041] VGAM649 gene, herein designated VGAM GENE, is a viral gene contained in the genome of acute bee paralysis virus. VGAM649 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9042] VGAM649 gene, herein designated VGAM GENE, encodes a VGAM649 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM649 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM649 precursor RNA is designated SEQ ID:635, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:635 is located at position 5290 relative to the genome of acute bee paralysis virus.

[9043] VGAM649 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM649 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9044] An enzyme complex designated DICER COMPLEX, dices the VGAM649 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM649 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM649 RNA is designated SEQ ID:3360, and is provided hereinbelow with reference to the sequence listing part.

[9045] VGAM649 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM649 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM649 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9046] VGAM649 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM649 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM649 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM649 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM649 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9047] The complementary binding of VGAM649 RNA, herein designated VGAM RNA, to host target binding sites on VGAM649 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM649 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM649 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9048] It is appreciated that VGAM649 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM649 host target genes. The mRNA of each one of this plurality of VGAM649 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM649 RNA, herein designated VGAM RNA, and which when bound by VGAM649 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM649 host target proteins.

[9049] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM649 gene, herein designated VGAM GENE, on one or more VGAM649 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9050] It is yet further appreciated that a function of VGAM649 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM649 include diagnosis, prevention and treatment of viral infection by acute bee paralysis virus. Specific functions, and accordingly utilities, of VGAM649 correlate with, and may be deduced from, the identity of the host target genes which VGAM649 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9051] Nucleotide sequences of the VGAM649 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM649 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM649 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM649 are further described hereinbelow with reference to Table 1.

[9052] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM649 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9053] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 650 (VGAM650) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9054] VGAM650 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM650 was detected is described hereinabove with reference to Figs. 2-8.

[9055] VGAM650 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM650 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[9056] VGAM650 gene, herein designated VGAM GENE, encodes a VGAM650 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM650 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM650 precursor RNA is designated SEQ ID:636, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:636 is located at position 10659 relative to the genome of Saimiriine herpesvirus 2.

[9057] VGAM650 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM650 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9058] An enzyme complex designated DICER COMPLEX, dices

the VGAM650 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM650 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM650 RNA is designated SEQ ID:3361, and is provided hereinbelow with reference to the sequence listing part.

[9059] VGAM650 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM650 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM650 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9060] VGAM650 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM650 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM650 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM650 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM650 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9061] The complementary binding of VGAM650 RNA, herein designated VGAM RNA, to host target binding sites on VGAM650 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM650 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM650 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9062] It is appreciated that VGAM650 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM650 host target genes. The mRNA of each one of this plurality of VGAM650 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM650 RNA, herein designated VGAM RNA, and which when bound by VGAM650 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM650 host target proteins.

[9063] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM650 gene, herein designated VGAM GENE, on one or more VGAM650 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9064] It is yet further appreciated that a function of VGAM650 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM650 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM650 correlate with, and may be deduced from, the identity of the host target genes which VGAM650 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9065] Nucleotide sequences of the VGAM650 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM650 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM650 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM650 are further described hereinbelow with reference to Table 1.

[9066] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM650 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9067] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 651 (VGAM651) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9068] VGAM651 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM651 was detected is described hereinabove with reference to Figs. 2-8.

[9069] VGAM651 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM651 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[9070] VGAM651 gene, herein designated VGAM GENE, encodes a VGAM651 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM651 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM651 precursor RNA is designated SEQ ID:637, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:637 is located at position 57033 relative to the genome of Meleagrid herpesvirus 1.

[9071] VGAM651 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM651 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9072] An enzyme complex designated DICER COMPLEX, dices the VGAM651 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM651 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM651 RNA is designated SEQ ID:3362, and is provided hereinbelow with reference to the sequence listing part.

[9073] VGAM651 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM651 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM651 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9074] VGAM651 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM651 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM651 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM651 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM651 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9075] The complementary binding of VGAM651 RNA, herein designated VGAM RNA, to host target binding sites on VGAM651 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM651 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM651 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9076] It is appreciated that VGAM651 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM651 host target genes. The mRNA of each one of this plurality of VGAM651 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM651 RNA, herein designated VGAM RNA, and which when bound by VGAM651 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM651 host target proteins.

[9077] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM651 gene, herein designated VGAM GENE, on one or more VGAM651 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9078] It is yet further appreciated that a function of VGAM651 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM651 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM651 correlate with, and may be deduced from, the identity of the host target genes which VGAM651 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9079] Nucleotide sequences of the VGAM651 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM651 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM651 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM651 are further described hereinbelow with reference to Table 1.

[9080] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM651 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9081] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 652 (VGAM652) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9082] VGAM652 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM652 was detected is described hereinabove with reference to Figs. 2-8.

[9083] VGAM652 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1.

VGAM652 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9084] VGAM652 gene, herein designated VGAM GENE, encodes a VGAM652 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM652 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM652 precursor RNA is designated SEQ ID:638, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:638 is located at position 62005 relative to the genome of Meleagrid herpesvirus 1.

[9085] VGAM652 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM652 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[9086] An enzyme complex designated DICER COMPLEX, dices the VGAM652 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM652 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM652 RNA is designated SEQ ID:3363, and is provided hereinbelow with reference to the sequence listing part.

[9087] VGAM652 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM652 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM652 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9088] VGAM652 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM652 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM652 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM652 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM652 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9089] The complementary binding of VGAM652 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM652 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM652 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM652 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9090] It is appreciated that VGAM652 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM652 host target genes. The mRNA of each one of this plurality of VGAM652 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM652 RNA, herein designated VGAM RNA, and which when bound by VGAM652 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM652 host target proteins.

[9091] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM652 gene, herein designated VGAM GENE, on one or more VGAM652 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9092] It is yet further appreciated that a function of VGAM652 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM652 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM652 correlate with, and may be deduced from, the identity of the host target genes which VGAM652 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9093] Nucleotide sequences of the VGAM652 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM652 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM652 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM652 are further described hereinbelow with reference to Table 1.

[9094] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM652 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9095] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 653 (VGAM653) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9096] VGAM653 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM653 was detected is described hereinabove with reference to Figs. 2-8.

[9097] VGAM653 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Meleagrid herpesvirus 1. VGAM653 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9098] VGAM653 gene, herein designated VGAM GENE, encodes a VGAM653 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM653 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM653 precursor RNA is designated SEQ ID:639, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:639 is located at position 62995 relative to the genome of Meleagrid herpesvirus 1.

[9099] VGAM653 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM653 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9100] An enzyme complex designated DICER COMPLEX, dices the VGAM653 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM653 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM653 RNA is designated SEQ ID:3364, and is provided hereinbelow with reference to the sequence listing part.

[9101] VGAM653 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM653 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM653 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9102] VGAM653 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM653 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM653 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM653 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM653 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9103] The complementary binding of VGAM653 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM653 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM653 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM653 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9104] It is appreciated that VGAM653 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM653 host target genes. The mRNA of each one of this plurality of VGAM653 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM653 RNA, herein designated VGAM RNA, and which when bound by VGAM653 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM653 host target proteins.

[9105] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM653 gene, herein designated VGAM GENE, on one or more VGAM653 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9106] It is yet further appreciated that a function of VGAM653 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM653 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM653 correlate with, and may be deduced from, the identity of the host target genes which VGAM653 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9107] Nucleotide sequences of the VGAM653 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM653 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM653 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM653 are further described hereinbelow with reference to Table 1.

[9108] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM653 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9109] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 654 (VGAM654) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9110] VGAM654 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM654 was detected is described hereinabove with reference to Figs. 2-8.

[9111] VGAM654 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM654 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9112] VGAM654 gene, herein designated VGAM GENE, encodes a VGAM654 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM654 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM654 precursor RNA is designated SEQ ID:640, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:640 is located at position 75545 relative to the genome of Meleagrid herpesvirus 1.

[9113] VGAM654 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM654 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9114] An enzyme complex designated DICER COMPLEX, dices the VGAM654 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM654 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM654 RNA is designated SEQ ID:3365, and is provided hereinbelow with reference to the sequence listing part.

[9115] VGAM654 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM654 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM654 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[9116] VGAM654 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM654 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM654 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM654 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM654 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9117] The complementary binding of VGAM654 RNA, herein designated VGAM RNA, to host target binding sites on VGAM654 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM654 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM654 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9118] It is appreciated that VGAM654 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM654 host target genes. The mRNA of each one of this plurality of VGAM654 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM654 RNA, herein designated VGAM RNA, and which when bound by VGAM654 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM654 host target proteins.

[9119] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM654 gene, herein designated VGAM GENE, on one or

more VGAM654 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9120] It is yet further appreciated that a function of VGAM654 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM654 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM654 correlate with, and may be deduced from, the identity of the host target genes which VGAM654 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9121] Nucleotide sequences of the VGAM654 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM654 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM654 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM654 are further described hereinbelow with reference to Table 1.

[9122] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM654 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9123] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 655 (VGAM655) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9124] VGAM655 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM655 was detected is described

hereinabove with reference to Figs. 2–8.

[9125] VGAM655 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM655 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9126] VGAM655 gene, herein designated VGAM GENE, encodes a VGAM655 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM655 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM655 precursor RNA is designated SEQ ID:641, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:641 is located at position 76605 relative to the genome of Meleagrid herpesvirus 1.

[9127] VGAM655 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM655 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9128] An enzyme complex designated DICER COMPLEX, dices the VGAM655 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM655 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM655 RNA is designated SEQ ID:3366, and is provided hereinbelow with reference to the sequence listing part.

[9129] VGAM655 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM655 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM655 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9130] VGAM655 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM655 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM655 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM655 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM655 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[9131] The complementary binding of VGAM655 RNA, herein designated VGAM RNA, to host target binding sites on VGAM655 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM655 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM655 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9132] It is appreciated that VGAM655 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM655 host target genes. The mRNA of each one of this plurality of VGAM655 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM655 RNA, herein designated VGAM RNA, and which when bound by VGAM655 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM655 host target proteins.

[9133] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM655 gene, herein designated VGAM GENE, on one or more VGAM655 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9134] It is yet further appreciated that a function of VGAM655 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM655 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM655 correlate with, and may be deduced from, the identity of the host target genes which VGAM655 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[9135] Nucleotide sequences of the VGAM655 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM655 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM655 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM655 are further described hereinbelow with reference to Table 1.

[9136] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM655 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9137] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 656 (VGAM656) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9138] VGAM656 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM656 was detected is described hereinabove with reference to Figs. 2–8.

[9139] VGAM656 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM656 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9140] VGAM656 gene, herein designated VGAM GENE, encodes a VGAM656 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM656 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM656 precursor RNA is designated SEQ ID:642, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:642 is located at position 77387 relative to the genome of Meleagrid herpesvirus 1.

[9141] VGAM656 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM656 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9142] An enzyme complex designated DICER COMPLEX, dices the VGAM656 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM656 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM656 RNA is designated SEQ ID:3367, and is provided hereinbelow with reference to the sequence listing part.

[9143] VGAM656 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM656 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM656 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9144] VGAM656 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM656 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM656 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM656 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM656 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9145] The complementary binding of VGAM656 RNA, herein designated VGAM RNA, to host target binding sites on VGAM656 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM656 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM656 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9146] It is appreciated that VGAM656 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM656 host target genes. The mRNA of each one of this plurality of VGAM656 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM656 RNA, herein designated VGAM RNA, and which when bound by VGAM656 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM656 host target proteins.

[9147] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM656 gene, herein designated VGAM GENE, on one or more VGAM656 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9148] It is yet further appreciated that a function of VGAM656 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM656 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM656 correlate with, and may be deduced from, the identity of the host target genes which VGAM656 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[9149] Nucleotide sequences of the VGAM656 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM656 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM656 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM656 are further described hereinbelow with reference to Table 1.

[9150] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM656 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9151] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 657 (VGAM657) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9152] VGAM657 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM657 was detected is described hereinabove with reference to Figs. 2–8.

[9153] VGAM657 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM657 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9154] VGAM657 gene, herein designated VGAM GENE, encodes a VGAM657 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM657 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM657 precursor RNA is designated SEQ ID:643, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:643 is located at position 75089 relative to the genome of Meleagrid herpesvirus 1.

[9155] VGAM657 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM657 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9156] An enzyme complex designated DICER COMPLEX, dices the VGAM657 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM657 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM657 RNA is designated SEQ ID:3368, and is provided hereinbelow with reference to the sequence listing part.

[9157] VGAM657 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM657 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM657 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9158] VGAM657 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM657 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM657 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM657 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM657 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9159] The complementary binding of VGAM657 RNA, herein designated VGAM RNA, to host target binding sites on VGAM657 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM657 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM657 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9160] It is appreciated that VGAM657 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM657 host target genes. The mRNA of each one of this plurality of VGAM657 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM657 RNA, herein designated VGAM RNA, and which when bound by VGAM657 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM657 host target proteins.

[9161] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM657 gene, herein designated VGAM GENE, on one or more VGAM657 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9162] It is yet further appreciated that a function of VGAM657 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM657 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM657 correlate with, and may be deduced from, the identity of

the host target genes which VGAM657 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9163] Nucleotide sequences of the VGAM657 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM657 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM657 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM657 are further described hereinbelow with reference to Table 1.

[9164] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM657 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9165] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 658 (VGAM658) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9166] VGAM658 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM658 was detected is described hereinabove with reference to Figs. 2–8.

[9167] VGAM658 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM658 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9168] VGAM658 gene, herein designated VGAM GENE, encodes a VGAM658 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM658 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM658 precursor RNA is designated SEQ ID:644, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:644 is located at position 79923 relative to the genome of Meleagrid herpesvirus 1.

[9169] VGAM658 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM658 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9170] An enzyme complex designated DICER COMPLEX, dices the VGAM658 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM658 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM658 RNA is designated SEQ ID:3369, and is provided hereinbelow with reference to the sequence listing part.

[9171] VGAM658 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM658 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM658 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9172] VGAM658 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM658 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM658 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM658 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM658 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9173] The complementary binding of VGAM658 RNA, herein designated VGAM RNA, to host target binding sites on VGAM658 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM658 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM658 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9174] It is appreciated that VGAM658 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM658 host target genes. The mRNA of each one of this plurality of VGAM658 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM658 RNA, herein designated VGAM RNA, and which when bound by VGAM658 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM658 host target proteins.

[9175] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM658 gene, herein designated VGAM GENE, on one or more VGAM658 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9176] It is yet further appreciated that a function of VGAM658 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM658 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM658

correlate with, and may be deduced from, the identity of the host target genes which VGAM658 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9177] Nucleotide sequences of the VGAM658 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM658 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM658 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM658 are further described hereinbelow with reference to Table 1.

[9178] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM658 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9179] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 659 (VGAM659) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[9180] VGAM659 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM659 was detected is described hereinabove with reference to Figs. 2–8.

[9181] VGAM659 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM659 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9182] VGAM659 gene, herein designated VGAM GENE, encodes a VGAM659 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM659 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM659 precursor RNA is designated SEQ ID:645, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:645 is located at position 80037 relative to the genome of Meleagrid herpesvirus 1.

[9183] VGAM659 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM659 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9184] An enzyme complex designated DICER COMPLEX, dices the VGAM659 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM659 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM659 RNA is designated SEQ ID:3370, and is provided hereinbelow with reference to the sequence listing part.

[9185] VGAM659 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM659 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM659 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9186] VGAM659 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM659 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM659 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM659 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM659 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9187] The complementary binding of VGAM659 RNA, herein designated VGAM RNA, to host target binding sites on VGAM659 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM659 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM659 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9188] It is appreciated that VGAM659 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM659 host target genes. The mRNA of each one of this plurality of VGAM659 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM659 RNA, herein designated VGAM RNA, and which when bound by VGAM659 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM659 host target proteins.

[9189] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM659 gene, herein designated VGAM GENE, on one or more VGAM659 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9190] It is yet further appreciated that a function of VGAM659 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM659 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM659 correlate with, and may be deduced from, the identity of the host target genes which VGAM659 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9191] Nucleotide sequences of the VGAM659 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM659 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM659 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM659 are further described hereinbelow with reference to Table 1.

[9192] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM659 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9193] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 660 (VGAM660) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9194] VGAM660 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM660 was detected is described hereinabove with reference to Figs. 2–8.

[9195] VGAM660 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM660 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9196] VGAM660 gene, herein designated VGAM GENE, encodes a VGAM660 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM660 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM660 precursor RNA is

designated SEQ ID:646, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:646 is located at position 80746 relative to the genome of Meleagrid herpesvirus 1.

[9197] VGAM660 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM660 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9198] An enzyme complex designated DICER COMPLEX, dices the VGAM660 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM660 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide se-

quence of VGAM660 RNA is designated SEQ ID:3371, and is provided hereinbelow with reference to the sequence listing part.

[9199] VGAM660 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM660 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM660 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9200] VGAM660 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM660 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM660 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM660 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM660 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9201] The complementary binding of VGAM660 RNA, herein designated VGAM RNA, to host target binding sites on VGAM660 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM660 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM660 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9202] It is appreciated that VGAM660 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM660 host target genes. The mRNA of

each one of this plurality of VGAM660 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM660 RNA, herein designated VGAM RNA, and which when bound by VGAM660 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM660 host target proteins.

[9203] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM660 gene, herein designated VGAM GENE, on one or more VGAM660 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[9204] It is yet further appreciated that a function of VGAM660 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM660 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM660 correlate with, and may be deduced from, the identity of the host target genes which VGAM660 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9205] Nucleotide sequences of the VGAM660 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM660 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM660 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM660 are further described hereinbelow with reference to Table 1.

[9206] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM660 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[9207] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 661 (VGAM661) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9208] VGAM661 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM661 was detected is described hereinabove with reference to Figs. 2–8.

[9209] VGAM661 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Heliothis zea virus 1 (HZV–1). VGAM661 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9210] VGAM661 gene, herein designated VGAM GENE, encodes a VGAM661 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM661 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM661 precursor RNA is designated SEQ ID:647, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:647 is located at position 4270 relative to the genome of Heliothis zea virus 1 (HZV-1).

[9211] VGAM661 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM661 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9212] An enzyme complex designated DICER COMPLEX, dices the VGAM661 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM661 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 83%) nucleotide sequence of VGAM661 RNA is designated SEQ ID:3372, and is provided hereinbelow with reference to the sequence listing part.

[9213] VGAM661 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM661 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM661 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9214] VGAM661 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM661 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM661 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM661 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM661 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9215] The complementary binding of VGAM661 RNA, herein designated VGAM RNA, to host target binding sites on VGAM661 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM661 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM661 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9216] It is appreciated that VGAM661 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM661 host target genes. The mRNA of each one of this plurality of VGAM661 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM661 RNA, herein designated VGAM RNA, and which when bound by VGAM661 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM661 host target proteins.

[9217] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM661 gene, herein designated VGAM GENE, on one or more VGAM661 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

- [9218] It is yet further appreciated that a function of VGAM661 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM661 include diagnosis, prevention and treatment of viral infection by Heliothis zea virus 1 (HZV-1). Specific functions, and accordingly utilities, of VGAM661 correlate with, and may be deduced from, the identity of the host target genes which VGAM661 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.
- [9219] Nucleotide sequences of the VGAM661 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM661 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM661 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM661 are further described hereinbelow with reference to Table 1.
- [9220] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM661 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9221] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 662 (VGAM662) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9222] VGAM662 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM662 was detected is described hereinabove with reference to Figs. 2–8.

[9223] VGAM662 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM662 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9224] VGAM662 gene, herein designated VGAM GENE, encodes a VGAM662 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM662 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM662 precursor RNA is designated SEQ ID:648, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:648 is located at position 123220 relative to the genome of Vaccinia virus.

[9225] VGAM662 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM662 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9226] An enzyme complex designated DICER COMPLEX, dices the VGAM662 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM662 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 80%) nucleotide sequence of VGAM662 RNA is designated SEQ ID:3373, and is provided hereinbelow with reference to the sequence listing part.

[9227] VGAM662 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM662 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM662 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9228] VGAM662 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM662 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM662 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM662 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM662 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9229] The complementary binding of VGAM662 RNA, herein designated VGAM RNA, to host target binding sites on VGAM662 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM662 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM662 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9230] It is appreciated that VGAM662 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM662 host target genes. The mRNA of each one of this plurality of VGAM662 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM662 RNA, herein designated VGAM RNA, and which when bound by VGAM662 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM662 host target proteins.

[9231] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM662 gene, herein designated VGAM GENE, on one or more VGAM662 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[9232] It is yet further appreciated that a function of VGAM662 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM662 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM662 correlate with, and may be deduced from, the identity of the host target genes which VGAM662 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[9233] Nucleotide sequences of the VGAM662 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM662 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM662 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM662 are further described hereinbelow with reference to Table 1.

[9234] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM662 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9235] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 663 (VGAM663) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9236] VGAM663 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM663 was detected is described hereinabove with reference to Figs. 2–8.

[9237] VGAM663 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rachiplusia ou multiple nucleopolyhedrovirus. VGAM663 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9238] VGAM663 gene, herein designated VGAM GENE, encodes a VGAM663 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM663 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM663 precursor RNA is designated SEQ ID:649, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:649 is located at position 325 relative to the genome of *Rachiplusia* ou multiple nucleopolyhedrovirus.

[9239] VGAM663 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM663 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9240] An enzyme complex designated DICER COMPLEX, dices the VGAM663 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM663 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM663 RNA is designated SEQ ID:3374, and is provided hereinbelow with reference to the sequence listing part.

[9241] VGAM663 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM663 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM663 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9242] VGAM663 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM663 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM663 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM663 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM663 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9243] The complementary binding of VGAM663 RNA, herein designated VGAM RNA, to host target binding sites on VGAM663 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM663 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM663 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9244] It is appreciated that VGAM663 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM663 host target genes. The mRNA of each one of this plurality of VGAM663 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM663 RNA, herein designated VGAM RNA, and which when bound by VGAM663 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM663 host target proteins.

[9245] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM663 gene, herein designated VGAM GENE, on one or more VGAM663 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9246] It is yet further appreciated that a function of VGAM663 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM663 include diagnosis, prevention and treatment of viral infection by Rachiplusia ou multiple nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM663 correlate with, and may be deduced from, the identity of the host target genes which VGAM663 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9247] Nucleotide sequences of the VGAM663 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM663 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM663 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM663 are further described hereinbelow with reference to Table 1.

[9248] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM663 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9249] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 664 (VGAM664) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9250] VGAM664 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM664 was detected is described hereinabove with reference to Figs. 2–8.

[9251] VGAM664 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rachiplusia ou multiple nucleopolyhedrovirus. VGAM664 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9252] VGAM664 gene, herein designated VGAM GENE, encodes a VGAM664 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM664 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM664 precursor RNA is designated SEQ ID:650, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:650 is located at position 18 relative to the genome of Rachiplusia ou multiple nucleopolyhedrovirus.

[9253] VGAM664 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM664 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9254] An enzyme complex designated DICER COMPLEX, dices the VGAM664 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM664 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM664 RNA is designated SEQ ID:3375, and is provided hereinbelow with reference to the sequence listing part.

[9255] VGAM664 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM664 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM664 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9256] VGAM664 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM664 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM664 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM664 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM664 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9257] The complementary binding of VGAM664 RNA, herein designated VGAM RNA, to host target binding sites on VGAM664 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM664 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM664 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[9258] It is appreciated that VGAM664 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM664 host target genes. The mRNA of each one of this plurality of VGAM664 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM664 RNA, herein designated VGAM RNA, and which when bound by VGAM664 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM664 host target proteins.

[9259] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM664 gene, herein designated VGAM GENE, on one or more VGAM664 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9260] It is yet further appreciated that a function of VGAM664 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM664 include diagnosis, prevention and treatment of viral infection by *Rachiplusia* ou multiple nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM664 correlate with, and may be deduced from, the identity of the host target genes which VGAM664 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9261] Nucleotide sequences of the VGAM664 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM664 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM664 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM664 are further described hereinbelow with reference to Table 1.

[9262] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM664 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9263] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 665 (VGAM665) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9264] VGAM665 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM665 was detected is described hereinabove with reference to Figs. 2-8.

[9265] VGAM665 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rachiplusia ou multiple nucleopolyhedrovirus. VGAM665 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9266] VGAM665 gene, herein designated VGAM GENE, encodes a VGAM665 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM665 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM665 precursor RNA is designated SEQ ID:651, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:651 is located at position 235 relative to the genome of Rachiplusia ou multiple nucleopolyhedrovirus.

[9267] VGAM665 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM665 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9268] An enzyme complex designated DICER COMPLEX, dices the VGAM665 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM665 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM665 RNA is designated SEQ ID:3376, and is provided hereinbelow with reference to the sequence listing part.

[9269] VGAM665 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM665 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM665 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9270] VGAM665 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM665 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM665 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM665 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM665 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9271] The complementary binding of VGAM665 RNA, herein designated VGAM RNA, to host target binding sites on VGAM665 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM665 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM665 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9272] It is appreciated that VGAM665 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM665 host target genes. The mRNA of each one of this plurality of VGAM665 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM665 RNA, herein designated VGAM RNA, and which when bound by VGAM665 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM665 host target proteins.

[9273] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM665 gene, herein designated VGAM GENE, on one or more VGAM665 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9274] It is yet further appreciated that a function of VGAM665 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM665 include diagnosis, prevention and treatment of viral infection by Rachiplusia ou multiple nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM665 correlate with, and may be deduced from, the identity of the host target genes which VGAM665 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9275] Nucleotide sequences of the VGAM665 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM665 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM665 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM665 are further de-

scribed hereinbelow with reference to Table 1.

[9276] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM665 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9277] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 666 (VGAM666) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9278] VGAM666 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM666 was detected is described hereinabove with reference to Figs. 2-8.

[9279] VGAM666 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like disease virus. VGAM666 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9280] VGAM666 gene, herein designated VGAM GENE, encodes a VGAM666 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM666 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM666 precursor RNA is designated SEQ ID:652, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:652 is located at position 27927 relative to the genome of Yaba-like disease virus.

[9281] VGAM666 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM666 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9282] An enzyme complex designated DICER COMPLEX, dices the VGAM666 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM666 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM666 RNA is designated SEQ ID:3377, and is provided hereinbelow with reference to the sequence listing part.

[9283] VGAM666 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM666 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM666 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9284] VGAM666 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM666 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM666 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM666 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM666 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9285] The complementary binding of VGAM666 RNA, herein designated VGAM RNA, to host target binding sites on VGAM666 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM666 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM666 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9286] It is appreciated that VGAM666 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM666 host target genes. The mRNA of each one of this plurality of VGAM666 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM666 RNA, herein designated VGAM RNA, and which when bound by VGAM666 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM666 host target proteins.

[9287] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM666 gene, herein designated VGAM GENE, on one or more VGAM666 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9288] It is yet further appreciated that a function of VGAM666 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM666 include diagnosis, prevention and treatment of viral infection by Yaba-like disease virus. Specific functions, and accordingly utilities, of VGAM666 correlate with, and may be deduced from, the identity of the host target genes which VGAM666 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9289] Nucleotide sequences of the VGAM666 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM666 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM666 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM666 are further described hereinbelow with reference to Table 1.

[9290] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM666 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9291] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 667 (VGAM667) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9292] VGAM667 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM667 was detected is described hereinabove with reference to Figs. 2-8.

[9293] VGAM667 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.

VGAM667 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[9294] VGAM667 gene, herein designated VGAM GENE, encodes a VGAM667 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM667 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM667 precursor RNA is designated SEQ ID:653, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:653 is located at position 242236 relative to the genome of Fowlpox virus.

[9295] VGAM667 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM667 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9296] An enzyme complex designated DICER COMPLEX, dices

the VGAM667 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM667 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM667 RNA is designated SEQ ID:3378, and is provided hereinbelow with reference to the sequence listing part.

[9297] VGAM667 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM667 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM667 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9298] VGAM667 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM667 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM667 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM667 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM667 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9299] The complementary binding of VGAM667 RNA, herein designated VGAM RNA, to host target binding sites on VGAM667 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM667 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM667 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9300] It is appreciated that VGAM667 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM667 host target genes. The mRNA of each one of this plurality of VGAM667 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM667 RNA, herein designated VGAM RNA, and which when bound by VGAM667 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM667 host target proteins.

[9301] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM667 gene, herein designated VGAM GENE, on one or more VGAM667 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9302] It is yet further appreciated that a function of VGAM667 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM667 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM667 correlate with, and may be deduced from, the identity of the host target genes which VGAM667 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9303] Nucleotide sequences of the VGAM667 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM667 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM667 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM667 are further described hereinbelow with reference to Table 1.

[9304] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM667 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9305] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 668 (VGAM668) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9306] VGAM668 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM668 was detected is described hereinabove with reference to Figs. 2-8.

[9307] VGAM668 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM668 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[9308] VGAM668 gene, herein designated VGAM GENE, encodes a VGAM668 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM668 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM668 precursor RNA is designated SEQ ID:654, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:654 is located at position 267154 relative to the genome of Fowlpox virus.

[9309] VGAM668 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM668 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

- [9310] An enzyme complex designated DICER COMPLEX, dices the VGAM668 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM668 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM668 RNA is designated SEQ ID:3379, and is provided hereinbelow with reference to the sequence listing part.
- [9311] VGAM668 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM668 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM668 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.
- [9312] VGAM668 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM668 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM668 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM668 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM668 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9313] The complementary binding of VGAM668 RNA, herein designated VGAM RNA, to host target binding sites on VGAM668 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM668 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM668 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9314] It is appreciated that VGAM668 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM668 host target genes. The mRNA of each one of this plurality of VGAM668 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM668 RNA, herein designated VGAM RNA, and which when bound by VGAM668 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM668 host target proteins.

[9315] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM668 gene, herein designated VGAM GENE, on one or more VGAM668 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9316] It is yet further appreciated that a function of VGAM668 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM668 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM668 correlate with, and may be deduced from, the identity of the host target genes which VGAM668 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9317] Nucleotide sequences of the VGAM668 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM668 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM668 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM668 are further described hereinbelow with reference to Table 1.

[9318] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM668 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9319] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 669 (VGAM669) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9320] VGAM669 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM669 was detected is described hereinabove with reference to Figs. 2-8.

[9321] VGAM669 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like disease virus.

VGAM669 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9322] VGAM669 gene, herein designated VGAM GENE, encodes a VGAM669 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM669 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM669 precursor RNA is designated SEQ ID:655, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:655 is located at position 42333 relative to the genome of Yaba-like disease virus.

[9323] VGAM669 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM669 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[9324] An enzyme complex designated DICER COMPLEX, dices the VGAM669 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM669 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM669 RNA is designated SEQ ID:3380, and is provided hereinbelow with reference to the sequence listing part.

[9325] VGAM669 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM669 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM669 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9326] VGAM669 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM669 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM669 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM669 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM669 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9327] The complementary binding of VGAM669 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM669 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM669 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM669 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9328] It is appreciated that VGAM669 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM669 host target genes. The mRNA of each one of this plurality of VGAM669 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM669 RNA, herein designated VGAM RNA, and which when bound by VGAM669 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM669 host target proteins.

[9329] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM669 gene, herein designated VGAM GENE, on one or more VGAM669 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9330] It is yet further appreciated that a function of VGAM669 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM669 include diagnosis, prevention and treatment of viral infection by Yaba-like disease virus. Specific functions, and accordingly utilities, of VGAM669 correlate with, and may be deduced from, the identity of the host target genes which VGAM669 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9331] Nucleotide sequences of the VGAM669 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM669 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM669 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM669 are further described hereinbelow with reference to Table 1.

[9332] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM669 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9333] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 670 (VGAM670) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9334] VGAM670 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM670 was detected is described hereinabove with reference to Figs. 2-8.

[9335] VGAM670 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Yaba-like disease virus. VGAM670 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9336] VGAM670 gene, herein designated VGAM GENE, encodes a VGAM670 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM670 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM670 precursor RNA is designated SEQ ID:656, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:656 is located at position 116988 relative to the genome of Yaba-like disease virus.

[9337] VGAM670 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM670 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9338] An enzyme complex designated DICER COMPLEX, dices the VGAM670 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM670 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM670 RNA is designated SEQ ID:3381, and is provided hereinbelow with reference to the sequence listing part.

[9339] VGAM670 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM670 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM670 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9340] VGAM670 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM670 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM670 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM670 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM670 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9341] The complementary binding of VGAM670 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM670 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM670 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM670 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9342] It is appreciated that VGAM670 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM670 host target genes. The mRNA of each one of this plurality of VGAM670 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM670 RNA, herein designated VGAM RNA, and which when bound by VGAM670 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM670 host target proteins.

[9343] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM670 gene, herein designated VGAM GENE, on one or more VGAM670 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9344] It is yet further appreciated that a function of VGAM670 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM670 include diagnosis, prevention and treatment of viral infection by Yaba-like disease virus. Specific functions, and accordingly utilities, of VGAM670 correlate with, and may be deduced from, the identity of the host target genes which VGAM670 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9345] Nucleotide sequences of the VGAM670 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM670 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM670 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM670 are further described hereinbelow with reference to Table 1.

[9346] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM670 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9347] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 671 (VGAM671) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9348] VGAM671 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM671 was detected is described hereinabove with reference to Figs. 2-8.

- [9349] VGAM671 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like disease virus. VGAM671 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.
- [9350] VGAM671 gene, herein designated VGAM GENE, encodes a VGAM671 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM671 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM671 precursor RNA is designated SEQ ID:657, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:657 is located at position 134323 relative to the genome of Yaba-like disease virus.
- [9351] VGAM671 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM671 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9352] An enzyme complex designated DICER COMPLEX, dices the VGAM671 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM671 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM671 RNA is designated SEQ ID:3382, and is provided hereinbelow with reference to the sequence listing part.

[9353] VGAM671 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM671 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM671 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[9354] VGAM671 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM671 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM671 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM671 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM671 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9355] The complementary binding of VGAM671 RNA, herein designated VGAM RNA, to host target binding sites on VGAM671 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM671 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM671 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9356] It is appreciated that VGAM671 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM671 host target genes. The mRNA of each one of this plurality of VGAM671 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM671 RNA, herein designated VGAM RNA, and which when bound by VGAM671 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM671 host target proteins.

[9357] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM671 gene, herein designated VGAM GENE, on one or

more VGAM671 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9358] It is yet further appreciated that a function of VGAM671 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM671 include diagnosis, prevention and treatment of viral infection by Yaba-like disease virus. Specific functions, and accordingly utilities, of VGAM671 correlate with, and may be deduced from, the identity of the host target genes which VGAM671 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9359] Nucleotide sequences of the VGAM671 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM671 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM671 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM671 are further described hereinbelow with reference to Table 1.

[9360] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM671 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9361] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 672 (VGAM672) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9362] VGAM672 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM672 was detected is described

hereinabove with reference to Figs. 2–8.

[9363] VGAM672 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like disease virus. VGAM672 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9364] VGAM672 gene, herein designated VGAM GENE, encodes a VGAM672 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM672 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM672 precursor RNA is designated SEQ ID:658, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:658 is located at position 134123 relative to the genome of Yaba-like disease virus.

[9365] VGAM672 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM672 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9366] An enzyme complex designated DICER COMPLEX, dices the VGAM672 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM672 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM672 RNA is designated SEQ ID:3383, and is provided hereinbelow with reference to the sequence listing part.

[9367] VGAM672 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM672 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM672 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9368] VGAM672 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM672 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM672 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM672 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM672 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[9369] The complementary binding of VGAM672 RNA, herein designated VGAM RNA, to host target binding sites on VGAM672 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM672 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM672 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9370] It is appreciated that VGAM672 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM672 host target genes. The mRNA of each one of this plurality of VGAM672 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM672 RNA, herein designated VGAM RNA, and which when bound by VGAM672 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM672 host target proteins.

[9371] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM672 gene, herein designated VGAM GENE, on one or more VGAM672 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9372] It is yet further appreciated that a function of VGAM672 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM672 include diagnosis, prevention and treatment of viral infection by Yaba-like disease virus. Specific functions, and accordingly utilities, of VGAM672 correlate with, and may be deduced from, the identity of the host target genes which VGAM672 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[9373] Nucleotide sequences of the VGAM672 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM672 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM672 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM672 are further described hereinbelow with reference to Table 1.

[9374] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM672 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9375] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 673 (VGAM673) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9376] VGAM673 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM673 was detected is described hereinabove with reference to Figs. 2–8.

[9377] VGAM673 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM673 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9378] VGAM673 gene, herein designated VGAM GENE, encodes a VGAM673 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM673 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM673 precursor RNA is designated SEQ ID:659, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:659 is located at position 15786 relative to the genome of Human coronavirus 229E.

[9379] VGAM673 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM673 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9380] An enzyme complex designated DICER COMPLEX, dices the VGAM673 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM673 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM673 RNA is designated SEQ ID:3384, and is provided hereinbelow with reference to the sequence listing part.

[9381] VGAM673 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM673 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM673 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9382] VGAM673 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM673 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM673 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM673 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM673 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9383] The complementary binding of VGAM673 RNA, herein designated VGAM RNA, to host target binding sites on VGAM673 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM673 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM673 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9384] It is appreciated that VGAM673 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM673 host target genes. The mRNA of each one of this plurality of VGAM673 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM673 RNA, herein designated VGAM RNA, and which when bound by VGAM673 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM673 host target proteins.

[9385] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM673 gene, herein designated VGAM GENE, on one or more VGAM673 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9386] It is yet further appreciated that a function of VGAM673 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM673 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM673 correlate with, and may be deduced from, the identity of the host target genes which VGAM673 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[9387] Nucleotide sequences of the VGAM673 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM673 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM673 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM673 are further described hereinbelow with reference to Table 1.

[9388] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM673 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9389] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 674 (VGAM674) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9390] VGAM674 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM674 was detected is described hereinabove with reference to Figs. 2–8.

[9391] VGAM674 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM674 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9392] VGAM674 gene, herein designated VGAM GENE, encodes a VGAM674 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM674 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM674 precursor RNA is designated SEQ ID:660, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:660 is located at position 10541 relative to the genome of Human coronavirus 229E.

[9393] VGAM674 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM674 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9394] An enzyme complex designated DICER COMPLEX, dices the VGAM674 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM674 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM674 RNA is designated SEQ ID:3385, and is provided hereinbelow with reference to the sequence listing part.

[9395] VGAM674 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM674 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM674 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9396] VGAM674 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM674 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM674 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM674 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM674 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9397] The complementary binding of VGAM674 RNA, herein designated VGAM RNA, to host target binding sites on VGAM674 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM674 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM674 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9398] It is appreciated that VGAM674 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM674 host target genes. The mRNA of each one of this plurality of VGAM674 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM674 RNA, herein designated VGAM RNA, and which when bound by VGAM674 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM674 host target proteins.

[9399] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM674 gene, herein designated VGAM GENE, on one or more VGAM674 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9400] It is yet further appreciated that a function of VGAM674 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM674 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM674 correlate with, and may be deduced from, the identity of

the host target genes which VGAM674 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9401] Nucleotide sequences of the VGAM674 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM674 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM674 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM674 are further described hereinbelow with reference to Table 1.

[9402] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM674 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9403] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 675 (VGAM675) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9404] VGAM675 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM675 was detected is described hereinabove with reference to Figs. 2–8.

[9405] VGAM675 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM675 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9406] VGAM675 gene, herein designated VGAM GENE, encodes a VGAM675 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM675 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM675 precursor RNA is designated SEQ ID:661, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:661 is located at position 12342 relative to the genome of Human coronavirus 229E.

[9407] VGAM675 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM675 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9408] An enzyme complex designated DICER COMPLEX, dices the VGAM675 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM675 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM675 RNA is designated SEQ ID:3386, and is provided hereinbelow with reference to the sequence listing part.

[9409] VGAM675 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM675 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM675 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9410] VGAM675 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM675 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM675 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM675 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM675 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9411] The complementary binding of VGAM675 RNA, herein designated VGAM RNA, to host target binding sites on VGAM675 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM675 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM675 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9412] It is appreciated that VGAM675 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM675 host target genes. The mRNA of each one of this plurality of VGAM675 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM675 RNA, herein designated VGAM RNA, and which when bound by VGAM675 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM675 host target proteins.

[9413] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM675 gene, herein designated VGAM GENE, on one or more VGAM675 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9414] It is yet further appreciated that a function of VGAM675 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM675 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM675

correlate with, and may be deduced from, the identity of the host target genes which VGAM675 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9415] Nucleotide sequences of the VGAM675 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM675 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM675 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM675 are further described hereinbelow with reference to Table 1.

[9416] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM675 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9417] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 676 (VGAM676) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[9418] VGAM676 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM676 was detected is described hereinabove with reference to Figs. 2–8.

[9419] VGAM676 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM676 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9420] VGAM676 gene, herein designated VGAM GENE, encodes a VGAM676 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM676 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM676 precursor RNA is designated SEQ ID:662, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:662 is located at position 13267 relative to the genome of Human coronavirus 229E.

[9421] VGAM676 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM676 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9422] An enzyme complex designated DICER COMPLEX, dices the VGAM676 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM676 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM676 RNA is designated SEQ ID:3387, and is provided hereinbelow with reference to the sequence listing part.

[9423] VGAM676 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM676 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM676 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9424] VGAM676 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM676 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM676 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM676 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM676 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9425] The complementary binding of VGAM676 RNA, herein designated VGAM RNA, to host target binding sites on VGAM676 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM676 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM676 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9426] It is appreciated that VGAM676 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM676 host target genes. The mRNA of each one of this plurality of VGAM676 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM676 RNA, herein designated VGAM RNA, and which when bound by VGAM676 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM676 host target proteins.

[9427] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM676 gene, herein designated VGAM GENE, on one or more VGAM676 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9428] It is yet further appreciated that a function of VGAM676 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM676 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E.

Specific functions, and accordingly utilities, of VGAM676 correlate with, and may be deduced from, the identity of the host target genes which VGAM676 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9429] Nucleotide sequences of the VGAM676 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM676 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM676 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM676 are further described hereinbelow with reference to Table 1.

[9430] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM676 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9431] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 677 (VGAM677) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[9432] VGAM677 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM677 was detected is described hereinabove with reference to Figs. 2–8.

[9433] VGAM677 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM677 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9434] VGAM677 gene, herein designated VGAM GENE, encodes a VGAM677 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM677 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM677 precursor RNA is designated SEQ ID:663, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:663 is located at position 4047 relative to the genome of Human coronavirus 229E.

[9435] VGAM677 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM677 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9436] An enzyme complex designated DICER COMPLEX, dices the VGAM677 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM677 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM677 RNA is designated SEQ ID:3388, and is provided hereinbelow with reference to the sequence listing part.

[9437] VGAM677 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM677 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM677 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9438] VGAM677 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM677 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM677 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM677 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM677 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9439] The complementary binding of VGAM677 RNA, herein designated VGAM RNA, to host target binding sites on VGAM677 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM677 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM677 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9440] It is appreciated that VGAM677 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM677 host target genes. The mRNA of each one of this plurality of VGAM677 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM677 RNA, herein designated VGAM RNA, and which when bound by VGAM677 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM677 host target proteins.

[9441] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM677 gene, herein designated VGAM GENE, on one or more VGAM677 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9442] It is yet further appreciated that a function of VGAM677 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM677 include diagnosis, prevention and

treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM677 correlate with, and may be deduced from, the identity of the host target genes which VGAM677 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9443] Nucleotide sequences of the VGAM677 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM677 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM677 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM677 are further described hereinbelow with reference to Table 1.

[9444] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM677 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9445] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 678 (VGAM678) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9446] VGAM678 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM678 was detected is described hereinabove with reference to Figs. 2–8.

[9447] VGAM678 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM678 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9448] VGAM678 gene, herein designated VGAM GENE, encodes a VGAM678 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM678 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM678 precursor RNA is designated SEQ ID:664, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:664 is located at position 16921 relative to the genome of Human coronavirus 229E.

[9449] VGAM678 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM678 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9450] An enzyme complex designated DICER COMPLEX, dices the VGAM678 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM678 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM678 RNA is designated SEQ ID:3389, and is provided hereinbelow with reference to the sequence listing part.

[9451] VGAM678 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM678 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM678 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9452] VGAM678 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM678 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM678 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM678 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM678 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9453] The complementary binding of VGAM678 RNA, herein designated VGAM RNA, to host target binding sites on VGAM678 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM678 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM678 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9454] It is appreciated that VGAM678 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM678 host target genes. The mRNA of each one of this plurality of VGAM678 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM678 RNA, herein designated VGAM

RNA, and which when bound by VGAM678 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM678 host target proteins.

[9455] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM678 gene, herein designated VGAM GENE, on one or more VGAM678 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9456] It is yet further appreciated that a function of VGAM678 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM678 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM678 correlate with, and may be deduced from, the identity of the host target genes which VGAM678 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9457] Nucleotide sequences of the VGAM678 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM678 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM678 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM678 are further described hereinbelow with reference to Table 1.

[9458] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM678 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9459] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 679 (VGAM679) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9460] VGAM679 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM679 was detected is described hereinabove with reference to Figs. 2–8.

[9461] VGAM679 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM679 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9462] VGAM679 gene, herein designated VGAM GENE, encodes a VGAM679 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM679 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM679 precursor RNA is designated SEQ ID:665, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:665 is located at position 1569 relative to

the genome of Human coronavirus 229E.

[9463] VGAM679 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM679 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9464] An enzyme complex designated DICER COMPLEX, dices the VGAM679 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM679 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM679 RNA is designated SEQ ID:3390, and is provided hereinbelow with reference to the sequence listing part.

[9465] VGAM679 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM679 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM679 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9466] VGAM679 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM679 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM679 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM679 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM679 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9467] The complementary binding of VGAM679 RNA, herein designated VGAM RNA, to host target binding sites on VGAM679 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM679 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM679 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9468] It is appreciated that VGAM679 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM679 host target genes. The mRNA of each one of this plurality of VGAM679 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM679 RNA, herein designated VGAM RNA, and which when bound by VGAM679 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM679 host target proteins.

[9469] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM679 gene, herein designated VGAM GENE, on one or more VGAM679 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9470] It is yet further appreciated that a function of VGAM679 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM679 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM679 correlate with, and may be deduced from, the identity of the host target genes which VGAM679 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9471] Nucleotide sequences of the VGAM679 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM679 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM679 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM679 are further described hereinbelow with reference to Table 1.

[9472] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM679 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9473] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 680 (VGAM680) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9474] VGAM680 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM680 was detected is described hereinabove with reference to Figs. 2–8.

[9475] VGAM680 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM680 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9476] VGAM680 gene, herein designated VGAM GENE, encodes a VGAM680 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM680 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM680 precursor RNA is designated SEQ ID:666, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:666 is located at position 14292 relative to the genome of Human coronavirus 229E.

[9477] VGAM680 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM680 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9478] An enzyme complex designated DICER COMPLEX, dices the VGAM680 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM680 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM680 RNA is designated SEQ ID:3391, and is provided hereinbelow with reference to the sequence

listing part.

[9479] VGAM680 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM680 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM680 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9480] VGAM680 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM680 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM680 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM680 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM680 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9481] The complementary binding of VGAM680 RNA, herein designated VGAM RNA, to host target binding sites on VGAM680 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM680 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM680 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9482] It is appreciated that VGAM680 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM680 host target genes. The mRNA of each one of this plurality of VGAM680 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM680 RNA, herein designated VGAM RNA, and which when bound by VGAM680 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM680 host target proteins.

[9483] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM680 gene, herein designated VGAM GENE, on one or more VGAM680 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9484] It is yet further appreciated that a function of VGAM680 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM680 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM680 correlate with, and may be deduced from, the identity of the host target genes which VGAM680 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9485] Nucleotide sequences of the VGAM680 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM680 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM680 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM680 are further described hereinbelow with reference to Table 1.

[9486] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM680 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9487] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 681 (VGAM681) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9488] VGAM681 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM681 was detected is described hereinabove with reference to Figs. 2–8.

[9489] VGAM681 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM681 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9490] VGAM681 gene, herein designated VGAM GENE, encodes a VGAM681 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM681 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM681 precursor RNA is designated SEQ ID:667, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:667 is located at position 9140 relative to the genome of Human coronavirus 229E.

[9491] VGAM681 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM681 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9492] An enzyme complex designated DICER COMPLEX, dices the VGAM681 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM681 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM681 RNA is designated SEQ ID:3392, and

is provided hereinbelow with reference to the sequence listing part.

[9493] VGAM681 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM681 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM681 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9494] VGAM681 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM681 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM681 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM681 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM681 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9495] The complementary binding of VGAM681 RNA, herein designated VGAM RNA, to host target binding sites on VGAM681 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM681 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM681 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9496] It is appreciated that VGAM681 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM681 host target genes. The mRNA of each one of this plurality of VGAM681 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM681 RNA, herein designated VGAM RNA, and which when bound by VGAM681 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM681 host target proteins.

[9497] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM681 gene, herein designated VGAM GENE, on one or more VGAM681 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9498] It is yet further appreciated that a function of VGAM681 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM681 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM681 correlate with, and may be deduced from, the identity of the host target genes which VGAM681 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9499] Nucleotide sequences of the VGAM681 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM681 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM681 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM681 are further described hereinbelow with reference to Table 1.

[9500] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM681 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9501] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 682 (VGAM682) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9502] VGAM682 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM682 was detected is described hereinabove with reference to Figs. 2–8.

[9503] VGAM682 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM682 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9504] VGAM682 gene, herein designated VGAM GENE, encodes a VGAM682 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM682 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM682 precursor RNA is

designated SEQ ID:668, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:668 is located at position 7304 relative to the genome of Human coronavirus 229E.

[9505] VGAM682 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM682 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9506] An enzyme complex designated DICER COMPLEX, dices the VGAM682 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM682 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide se-

quence of VGAM682 RNA is designated SEQ ID:3393, and is provided hereinbelow with reference to the sequence listing part.

[9507] VGAM682 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM682 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM682 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9508] VGAM682 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM682 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM682 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM682 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM682 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9509] The complementary binding of VGAM682 RNA, herein designated VGAM RNA, to host target binding sites on VGAM682 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM682 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM682 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9510] It is appreciated that VGAM682 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM682 host target genes. The mRNA of

each one of this plurality of VGAM682 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM682 RNA, herein designated VGAM RNA, and which when bound by VGAM682 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM682 host target proteins.

[9511] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM682 gene, herein designated VGAM GENE, on one or more VGAM682 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[9512] It is yet further appreciated that a function of VGAM682 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM682 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM682 correlate with, and may be deduced from, the identity of the host target genes which VGAM682 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9513] Nucleotide sequences of the VGAM682 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM682 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM682 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM682 are further described hereinbelow with reference to Table 1.

[9514] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM682 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[9515] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 683 (VGAM683) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9516] VGAM683 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM683 was detected is described hereinabove with reference to Figs. 2–8.

[9517] VGAM683 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM683 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9518] VGAM683 gene, herein designated VGAM GENE, encodes a VGAM683 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM683 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM683 precursor RNA is designated SEQ ID:669, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:669 is located at position 19339 relative to the genome of Human coronavirus 229E.

[9519] VGAM683 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM683 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9520] An enzyme complex designated DICER COMPLEX, dices the VGAM683 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM683 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 45%) nucleotide sequence of VGAM683 RNA is designated SEQ ID:3394, and is provided hereinbelow with reference to the sequence listing part.

[9521] VGAM683 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM683 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM683 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9522] VGAM683 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM683 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM683 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM683 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM683 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9523] The complementary binding of VGAM683 RNA, herein designated VGAM RNA, to host target binding sites on VGAM683 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM683 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM683 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9524] It is appreciated that VGAM683 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM683 host target genes. The mRNA of each one of this plurality of VGAM683 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM683 RNA, herein designated VGAM RNA, and which when bound by VGAM683 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM683 host target proteins.

[9525] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM683 gene, herein designated VGAM GENE, on one or more VGAM683 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[9526] It is yet further appreciated that a function of VGAM683 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM683 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM683 correlate with, and may be deduced from, the identity of the host target genes which VGAM683 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9527] Nucleotide sequences of the VGAM683 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM683 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM683 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM683 are further described hereinbelow with reference to Table 1.

[9528] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM683 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9529] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 684 (VGAM684) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9530] VGAM684 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM684 was detected is described hereinabove with reference to Figs. 2–8.

[9531] VGAM684 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM684 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9532] VGAM684 gene, herein designated VGAM GENE, encodes a VGAM684 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM684 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM684 precursor RNA is designated SEQ ID:670, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:670 is located at position 18943 relative to the genome of Human coronavirus 229E.

[9533] VGAM684 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM684 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9534] An enzyme complex designated DICER COMPLEX, dices the VGAM684 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM684 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM684 RNA is designated SEQ ID:3395, and is provided hereinbelow with reference to the sequence listing part.

[9535] VGAM684 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM684 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM684 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9536] VGAM684 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM684 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM684 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM684 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM684 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9537] The complementary binding of VGAM684 RNA, herein designated VGAM RNA, to host target binding sites on VGAM684 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM684 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM684 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9538] It is appreciated that VGAM684 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM684 host target genes. The mRNA of each one of this plurality of VGAM684 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM684 RNA, herein designated VGAM RNA, and which when bound by VGAM684 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM684 host target proteins.

[9539] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM684 gene, herein designated VGAM GENE, on one or more VGAM684 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9540] It is yet further appreciated that a function of VGAM684 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM684 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM684 correlate with, and may be deduced from, the identity of the host target genes which VGAM684 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9541] Nucleotide sequences of the VGAM684 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM684 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM684 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM684 are further described hereinbelow with reference to Table 1.

[9542] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM684 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9543] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 685 (VGAM685) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9544] VGAM685 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM685 was detected is described hereinabove with reference to Figs. 2–8.

[9545] VGAM685 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM685 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9546] VGAM685 gene, herein designated VGAM GENE, encodes a VGAM685 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM685 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM685 precursor RNA is designated SEQ ID:671, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:671 is located at position 8018 relative to the genome of Human coronavirus 229E.

[9547] VGAM685 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM685 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9548] An enzyme complex designated DICER COMPLEX, dices the VGAM685 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM685 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM685 RNA is designated SEQ ID:3396, and is provided hereinbelow with reference to the sequence listing part.

[9549] VGAM685 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM685 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM685 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9550] VGAM685 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM685 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM685 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM685 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM685 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9551] The complementary binding of VGAM685 RNA, herein designated VGAM RNA, to host target binding sites on VGAM685 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM685 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM685 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9552] It is appreciated that VGAM685 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM685 host target genes. The mRNA of each one of this plurality of VGAM685 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM685 RNA, herein designated VGAM RNA, and which when bound by VGAM685 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM685 host target proteins.

[9553] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM685 gene, herein designated VGAM GENE, on one or more VGAM685 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9554] It is yet further appreciated that a function of VGAM685 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM685 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM685 correlate with, and may be deduced from, the identity of the host target genes which VGAM685 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9555] Nucleotide sequences of the VGAM685 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM685 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM685 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM685 are further described hereinbelow with reference to Table 1.

[9556] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM685 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9557] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 686 (VGAM686) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9558] VGAM686 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM686 was detected is described hereinabove with reference to Figs. 2–8.

[9559] VGAM686 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM686 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9560] VGAM686 gene, herein designated VGAM GENE, encodes a VGAM686 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM686 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM686 precursor RNA is designated SEQ ID:672, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:672 is located at position 14152 relative to the genome of Human coronavirus 229E.

[9561] VGAM686 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM686 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9562] An enzyme complex designated DICER COMPLEX, dices the VGAM686 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM686 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM686 RNA is designated SEQ ID:3397, and is provided hereinbelow with reference to the sequence listing part.

[9563] VGAM686 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM686 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM686 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9564] VGAM686 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM686 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM686 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM686 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM686 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9565] The complementary binding of VGAM686 RNA, herein designated VGAM RNA, to host target binding sites on VGAM686 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM686 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM686 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[9566] It is appreciated that VGAM686 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM686 host target genes. The mRNA of each one of this plurality of VGAM686 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM686 RNA, herein designated VGAM RNA, and which when bound by VGAM686 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM686 host target proteins.

[9567] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM686 gene, herein designated VGAM GENE, on one or more VGAM686 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9568] It is yet further appreciated that a function of VGAM686 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM686 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM686 correlate with, and may be deduced from, the identity of the host target genes which VGAM686 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9569] Nucleotide sequences of the VGAM686 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM686 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM686 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM686 are further described hereinbelow with reference to Table 1.

[9570] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM686 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9571] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 687 (VGAM687) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9572] VGAM687 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM687 was detected is described hereinabove with reference to Figs. 2-8.

[9573] VGAM687 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM687 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9574] VGAM687 gene, herein designated VGAM GENE, encodes a VGAM687 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM687 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM687 precursor RNA is designated SEQ ID:673, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:673 is located at position 14557 relative to the genome of Human coronavirus 229E.

[9575] VGAM687 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM687 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9576] An enzyme complex designated DICER COMPLEX, dices the VGAM687 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM687 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM687 RNA is designated SEQ ID:3398, and is provided hereinbelow with reference to the sequence listing part.

[9577] VGAM687 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM687 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM687 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9578] VGAM687 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM687 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM687 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM687 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM687 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9579] The complementary binding of VGAM687 RNA, herein designated VGAM RNA, to host target binding sites on VGAM687 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM687 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM687 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9580] It is appreciated that VGAM687 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM687 host target genes. The mRNA of each one of this plurality of VGAM687 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM687 RNA, herein designated VGAM RNA, and which when bound by VGAM687 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM687 host target proteins.

[9581] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM687 gene, herein designated VGAM GENE, on one or more VGAM687 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9582] It is yet further appreciated that a function of VGAM687 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM687 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM687 correlate with, and may be deduced from, the identity of the host target genes which VGAM687 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9583] Nucleotide sequences of the VGAM687 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM687 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM687 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM687 are further described hereinbelow with reference to Table 1.

[9584] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM687 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9585] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 688 (VGAM688) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9586] VGAM688 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM688 was detected is described hereinabove with reference to Figs. 2-8.

[9587] VGAM688 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM688 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9588] VGAM688 gene, herein designated VGAM GENE, encodes a

VGAM688 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM688 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM688 precursor RNA is designated SEQ ID:674, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:674 is located at position 7056 relative to the genome of Human coronavirus 229E.

[9589] VGAM688 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM688 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9590] An enzyme complex designated DICER COMPLEX, dices the VGAM688 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM688 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM688 RNA is designated SEQ ID:3399, and is provided hereinbelow with reference to the sequence listing part.

[9591] VGAM688 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM688 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM688 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9592] VGAM688 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM688 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM688 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM688 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM688 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9593] The complementary binding of VGAM688 RNA, herein designated VGAM RNA, to host target binding sites on VGAM688 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM688 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM688 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9594] It is appreciated that VGAM688 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM688 host target genes. The mRNA of each one of this plurality of VGAM688 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM688 RNA, herein designated VGAM RNA, and which when bound by VGAM688 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM688 host target proteins.

[9595] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM688 gene, herein designated VGAM GENE, on one or more VGAM688 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9596] It is yet further appreciated that a function of VGAM688 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM688 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM688 correlate with, and may be deduced from, the identity of the host target genes which VGAM688 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9597] Nucleotide sequences of the VGAM688 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM688 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM688 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM688 are further de-

scribed hereinbelow with reference to Table 1.

[9598] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM688 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9599] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 689 (VGAM689) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9600] VGAM689 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM689 was detected is described hereinabove with reference to Figs. 2-8.

[9601] VGAM689 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM689 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9602] VGAM689 gene, herein designated VGAM GENE, encodes a VGAM689 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM689 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM689 precursor RNA is designated SEQ ID:675, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:675 is located at position 19049 relative to the genome of Human coronavirus 229E.

[9603] VGAM689 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM689 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9604] An enzyme complex designated DICER COMPLEX, dices the VGAM689 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM689 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM689 RNA is designated SEQ ID:3400, and is provided hereinbelow with reference to the sequence listing part.

[9605] VGAM689 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM689 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM689 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9606] VGAM689 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM689 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM689 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM689 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM689 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9607] The complementary binding of VGAM689 RNA, herein designated VGAM RNA, to host target binding sites on VGAM689 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM689 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM689 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9608] It is appreciated that VGAM689 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM689 host target genes. The mRNA of each one of this plurality of VGAM689 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM689 RNA, herein designated VGAM RNA, and which when bound by VGAM689 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM689 host target proteins.

[9609] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM689 gene, herein designated VGAM GENE, on one or more VGAM689 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9610] It is yet further appreciated that a function of VGAM689 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM689 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM689 correlate with, and may be deduced from, the identity of the host target genes which VGAM689 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9611] Nucleotide sequences of the VGAM689 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM689 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM689 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM689 are further described hereinbelow with reference to Table 1.

[9612] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM689 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9613] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 690 (VGAM690) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9614] VGAM690 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM690 was detected is described hereinabove with reference to Figs. 2-8.

[9615] VGAM690 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM690 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[9616] VGAM690 gene, herein designated VGAM GENE, encodes a VGAM690 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM690 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM690 precursor RNA is designated SEQ ID:676, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:676 is located at position 5793 relative to the genome of Human coronavirus 229E.

[9617] VGAM690 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM690 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9618] An enzyme complex designated DICER COMPLEX, dices

the VGAM690 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM690 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM690 RNA is designated SEQ ID:3401, and is provided hereinbelow with reference to the sequence listing part.

[9619] VGAM690 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM690 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM690 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9620] VGAM690 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM690 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM690 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM690 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM690 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9621] The complementary binding of VGAM690 RNA, herein designated VGAM RNA, to host target binding sites on VGAM690 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM690 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM690 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9622] It is appreciated that VGAM690 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM690 host target genes. The mRNA of each one of this plurality of VGAM690 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM690 RNA, herein designated VGAM RNA, and which when bound by VGAM690 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM690 host target proteins.

[9623] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM690 gene, herein designated VGAM GENE, on one or more VGAM690 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9624] It is yet further appreciated that a function of VGAM690 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM690 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM690 correlate with, and may be deduced from, the identity of the host target genes which VGAM690 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9625] Nucleotide sequences of the VGAM690 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM690 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM690 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM690 are further described hereinbelow with reference to Table 1.

[9626] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM690 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9627] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 691 (VGAM691) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9628] VGAM691 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM691 was detected is described hereinabove with reference to Figs. 2-8.

[9629] VGAM691 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM691 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9630] VGAM691 gene, herein designated VGAM GENE, encodes a VGAM691 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM691 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM691 precursor RNA is designated SEQ ID:677, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:677 is located at position 13850 relative to the genome of Human coronavirus 229E.

[9631] VGAM691 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM691 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9632] An enzyme complex designated DICER COMPLEX, dices the VGAM691 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM691 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM691 RNA is designated SEQ ID:3402, and is provided hereinbelow with reference to the sequence listing part.

[9633] VGAM691 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM691 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM691 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9634] VGAM691 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM691 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM691 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM691 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM691 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9635] The complementary binding of VGAM691 RNA, herein designated VGAM RNA, to host target binding sites on VGAM691 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM691 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM691 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9636] It is appreciated that VGAM691 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM691 host target genes. The mRNA of each one of this plurality of VGAM691 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM691 RNA, herein designated VGAM RNA, and which when bound by VGAM691 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM691 host target proteins.

[9637] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM691 gene, herein designated VGAM GENE, on one or more VGAM691 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9638] It is yet further appreciated that a function of VGAM691 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM691 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM691 correlate with, and may be deduced from, the identity of the host target genes which VGAM691 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9639] Nucleotide sequences of the VGAM691 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM691 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM691 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM691 are further described hereinbelow with reference to Table 1.

[9640] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM691 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9641] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 692 (VGAM692) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9642] VGAM692 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM692 was detected is described hereinabove with reference to Figs. 2-8.

[9643] VGAM692 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus

229E. VGAM692 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9644] VGAM692 gene, herein designated VGAM GENE, encodes a VGAM692 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM692 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM692 precursor RNA is designated SEQ ID:678, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:678 is located at position 6444 relative to the genome of Human coronavirus 229E.

[9645] VGAM692 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM692 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[9646] An enzyme complex designated DICER COMPLEX, dices the VGAM692 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM692 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM692 RNA is designated SEQ ID:3403, and is provided hereinbelow with reference to the sequence listing part.

[9647] VGAM692 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM692 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM692 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9648] VGAM692 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM692 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM692 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM692 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM692 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9649] The complementary binding of VGAM692 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM692 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM692 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM692 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9650] It is appreciated that VGAM692 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM692 host target genes. The mRNA of each one of this plurality of VGAM692 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM692 RNA, herein designated VGAM RNA, and which when bound by VGAM692 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM692 host target proteins.

[9651] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM692 gene, herein designated VGAM GENE, on one or more VGAM692 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9652] It is yet further appreciated that a function of VGAM692 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM692 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM692 correlate with, and may be deduced from, the identity of the host target genes which VGAM692 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9653] Nucleotide sequences of the VGAM692 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM692 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM692 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM692 are further described hereinbelow with reference to Table 1.

[9654] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM692 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9655] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 693 (VGAM693) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9656] VGAM693 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM693 was detected is described hereinabove with reference to Figs. 2-8.

[9657] VGAM693 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human coronavirus 229E. VGAM693 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9658] VGAM693 gene, herein designated VGAM GENE, encodes a VGAM693 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM693 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM693 precursor RNA is designated SEQ ID:679, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:679 is located at position 4759 relative to the genome of Human coronavirus 229E.

[9659] VGAM693 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM693 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9660] An enzyme complex designated DICER COMPLEX, dices the VGAM693 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM693 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM693 RNA is designated SEQ ID:3404, and is provided hereinbelow with reference to the sequence listing part.

[9661] VGAM693 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM693 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM693 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9662] VGAM693 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM693 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM693 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM693 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM693 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9663] The complementary binding of VGAM693 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM693 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM693 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM693 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9664] It is appreciated that VGAM693 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM693 host target genes. The mRNA of each one of this plurality of VGAM693 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM693 RNA, herein designated VGAM RNA, and which when bound by VGAM693 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM693 host target proteins.

[9665] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM693 gene, herein designated VGAM GENE, on one or more VGAM693 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9666] It is yet further appreciated that a function of VGAM693 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM693 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM693 correlate with, and may be deduced from, the identity of the host target genes which VGAM693 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9667] Nucleotide sequences of the VGAM693 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM693 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM693 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM693 are further described hereinbelow with reference to Table 1.

[9668] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM693 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9669] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 694 (VGAM694) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9670] VGAM694 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM694 was detected is described hereinabove with reference to Figs. 2-8.

- [9671] VGAM694 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM694 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.
- [9672] VGAM694 gene, herein designated VGAM GENE, encodes a VGAM694 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM694 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM694 precursor RNA is designated SEQ ID:680, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:680 is located at position 9591 relative to the genome of Human coronavirus 229E.
- [9673] VGAM694 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM694 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9674] An enzyme complex designated DICER COMPLEX, dices the VGAM694 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM694 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM694 RNA is designated SEQ ID:3405, and is provided hereinbelow with reference to the sequence listing part.

[9675] VGAM694 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM694 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM694 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[9676] VGAM694 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM694 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM694 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM694 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM694 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9677] The complementary binding of VGAM694 RNA, herein designated VGAM RNA, to host target binding sites on VGAM694 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM694 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM694 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9678] It is appreciated that VGAM694 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM694 host target genes. The mRNA of each one of this plurality of VGAM694 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM694 RNA, herein designated VGAM RNA, and which when bound by VGAM694 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM694 host target proteins.

[9679] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM694 gene, herein designated VGAM GENE, on one or

more VGAM694 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9680] It is yet further appreciated that a function of VGAM694 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM694 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM694 correlate with, and may be deduced from, the identity of the host target genes which VGAM694 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9681] Nucleotide sequences of the VGAM694 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM694 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM694 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM694 are further described hereinbelow with reference to Table 1.

[9682] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM694 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9683] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 695 (VGAM695) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9684] VGAM695 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM695 was detected is described

hereinabove with reference to Figs. 2–8.

[9685] VGAM695 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM695 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9686] VGAM695 gene, herein designated VGAM GENE, encodes a VGAM695 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM695 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM695 precursor RNA is designated SEQ ID:681, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:681 is located at position 2788 relative to the genome of Human coronavirus 229E.

[9687] VGAM695 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM695 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9688] An enzyme complex designated DICER COMPLEX, dices the VGAM695 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM695 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM695 RNA is designated SEQ ID:3406, and is provided hereinbelow with reference to the sequence listing part.

[9689] VGAM695 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM695 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM695 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9690] VGAM695 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM695 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM695 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM695 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM695 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[9691] The complementary binding of VGAM695 RNA, herein designated VGAM RNA, to host target binding sites on VGAM695 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM695 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM695 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9692] It is appreciated that VGAM695 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM695 host target genes. The mRNA of each one of this plurality of VGAM695 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM695 RNA, herein designated VGAM RNA, and which when bound by VGAM695 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM695 host target proteins.

[9693] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM695 gene, herein designated VGAM GENE, on one or more VGAM695 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9694] It is yet further appreciated that a function of VGAM695 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM695 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM695 correlate with, and may be deduced from, the identity of the host target genes which VGAM695 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[9695] Nucleotide sequences of the VGAM695 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM695 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM695 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM695 are further described hereinbelow with reference to Table 1.

[9696] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM695 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9697] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 696 (VGAM696) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9698] VGAM696 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM696 was detected is described hereinabove with reference to Figs. 2–8.

[9699] VGAM696 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM696 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9700] VGAM696 gene, herein designated VGAM GENE, encodes a VGAM696 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM696 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM696 precursor RNA is designated SEQ ID:682, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:682 is located at position 13163 relative to the genome of Human coronavirus 229E.

[9701] VGAM696 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM696 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9702] An enzyme complex designated DICER COMPLEX, dices the VGAM696 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM696 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM696 RNA is designated SEQ ID:3407, and is provided hereinbelow with reference to the sequence listing part.

[9703] VGAM696 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM696 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM696 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9704] VGAM696 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM696 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM696 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM696 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM696 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9705] The complementary binding of VGAM696 RNA, herein designated VGAM RNA, to host target binding sites on VGAM696 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM696 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM696 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9706] It is appreciated that VGAM696 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM696 host target genes. The mRNA of each one of this plurality of VGAM696 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM696 RNA, herein designated VGAM RNA, and which when bound by VGAM696 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM696 host target proteins.

[9707] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM696 gene, herein designated VGAM GENE, on one or more VGAM696 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9708] It is yet further appreciated that a function of VGAM696 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM696 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM696 correlate with, and may be deduced from, the identity of the host target genes which VGAM696 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[9709] Nucleotide sequences of the VGAM696 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM696 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM696 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM696 are further described hereinbelow with reference to Table 1.

[9710] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM696 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9711] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 697 (VGAM697) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9712] VGAM697 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM697 was detected is described hereinabove with reference to Figs. 2–8.

[9713] VGAM697 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM697 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9714] VGAM697 gene, herein designated VGAM GENE, encodes a VGAM697 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM697 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM697 precursor RNA is designated SEQ ID:683, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:683 is located at position 2149 relative to the genome of Human coronavirus 229E.

[9715] VGAM697 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM697 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9716] An enzyme complex designated DICER COMPLEX, dices the VGAM697 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM697 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 68%) nucleotide sequence of VGAM697 RNA is designated SEQ ID:3408, and is provided hereinbelow with reference to the sequence listing part.

[9717] VGAM697 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM697 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM697 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9718] VGAM697 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM697 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM697 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM697 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM697 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9719] The complementary binding of VGAM697 RNA, herein designated VGAM RNA, to host target binding sites on VGAM697 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM697 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM697 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9720] It is appreciated that VGAM697 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM697 host target genes. The mRNA of each one of this plurality of VGAM697 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM697 RNA, herein designated VGAM RNA, and which when bound by VGAM697 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM697 host target proteins.

[9721] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM697 gene, herein designated VGAM GENE, on one or more VGAM697 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9722] It is yet further appreciated that a function of VGAM697 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM697 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM697 correlate with, and may be deduced from, the identity of

the host target genes which VGAM697 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9723] Nucleotide sequences of the VGAM697 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM697 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM697 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM697 are further described hereinbelow with reference to Table 1.

[9724] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM697 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9725] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 698 (VGAM698) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9726] VGAM698 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM698 was detected is described hereinabove with reference to Figs. 2–8.

[9727] VGAM698 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM698 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9728] VGAM698 gene, herein designated VGAM GENE, encodes a VGAM698 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM698 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM698 precursor RNA is designated SEQ ID:684, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:684 is located at position 16358 relative to the genome of Human coronavirus 229E.

[9729] VGAM698 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM698 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9730] An enzyme complex designated DICER COMPLEX, dices the VGAM698 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM698 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM698 RNA is designated SEQ ID:3409, and is provided hereinbelow with reference to the sequence listing part.

[9731] VGAM698 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM698 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM698 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9732] VGAM698 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM698 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM698 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM698 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM698 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9733] The complementary binding of VGAM698 RNA, herein designated VGAM RNA, to host target binding sites on VGAM698 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM698 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM698 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9734] It is appreciated that VGAM698 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM698 host target genes. The mRNA of each one of this plurality of VGAM698 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM698 RNA, herein designated VGAM RNA, and which when bound by VGAM698 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM698 host target proteins.

[9735] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM698 gene, herein designated VGAM GENE, on one or more VGAM698 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9736] It is yet further appreciated that a function of VGAM698 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM698 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM698

correlate with, and may be deduced from, the identity of the host target genes which VGAM698 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9737] Nucleotide sequences of the VGAM698 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM698 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM698 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM698 are further described hereinbelow with reference to Table 1.

[9738] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM698 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9739] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 699 (VGAM699) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[9740] VGAM699 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM699 was detected is described hereinabove with reference to Figs. 2–8.

[9741] VGAM699 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM699 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9742] VGAM699 gene, herein designated VGAM GENE, encodes a VGAM699 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM699 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM699 precursor RNA is designated SEQ ID:685, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:685 is located at position 2991 relative to the genome of Human coronavirus 229E.

[9743] VGAM699 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM699 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9744] An enzyme complex designated DICER COMPLEX, dices the VGAM699 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM699 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM699 RNA is designated SEQ ID:3410, and is provided hereinbelow with reference to the sequence listing part.

[9745] VGAM699 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM699 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM699 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9746] VGAM699 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM699 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM699 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM699 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM699 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9747] The complementary binding of VGAM699 RNA, herein designated VGAM RNA, to host target binding sites on VGAM699 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM699 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM699 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9748] It is appreciated that VGAM699 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM699 host target genes. The mRNA of each one of this plurality of VGAM699 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM699 RNA, herein designated VGAM RNA, and which when bound by VGAM699 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM699 host target proteins.

[9749] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM699 gene, herein designated VGAM GENE, on one or more VGAM699 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9750] It is yet further appreciated that a function of VGAM699 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM699 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E.

Specific functions, and accordingly utilities, of VGAM699 correlate with, and may be deduced from, the identity of the host target genes which VGAM699 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9751] Nucleotide sequences of the VGAM699 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM699 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM699 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM699 are further described hereinbelow with reference to Table 1.

[9752] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM699 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9753] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 700 (VGAM700) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[9754] VGAM700 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM700 was detected is described hereinabove with reference to Figs. 2–8.

[9755] VGAM700 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM700 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9756] VGAM700 gene, herein designated VGAM GENE, encodes a VGAM700 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM700 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM700 precursor RNA is designated SEQ ID:686, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:686 is located at position 5282 relative to the genome of Human coronavirus 229E.

[9757] VGAM700 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM700 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9758] An enzyme complex designated DICER COMPLEX, dices the VGAM700 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM700 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM700 RNA is designated SEQ ID:3411, and is provided hereinbelow with reference to the sequence listing part.

[9759] VGAM700 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM700 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM700 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9760] VGAM700 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM700 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM700 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM700 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM700 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9761] The complementary binding of VGAM700 RNA, herein designated VGAM RNA, to host target binding sites on VGAM700 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM700 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM700 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9762] It is appreciated that VGAM700 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM700 host target genes. The mRNA of each one of this plurality of VGAM700 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM700 RNA, herein designated VGAM RNA, and which when bound by VGAM700 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM700 host target proteins.

[9763] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM700 gene, herein designated VGAM GENE, on one or more VGAM700 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9764] It is yet further appreciated that a function of VGAM700 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM700 include diagnosis, prevention and

treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM700 correlate with, and may be deduced from, the identity of the host target genes which VGAM700 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9765] Nucleotide sequences of the VGAM700 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM700 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM700 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM700 are further described hereinbelow with reference to Table 1.

[9766] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM700 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9767] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 701 (VGAM701) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9768] VGAM701 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM701 was detected is described hereinabove with reference to Figs. 2–8.

[9769] VGAM701 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM701 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9770] VGAM701 gene, herein designated VGAM GENE, encodes a VGAM701 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM701 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM701 precursor RNA is designated SEQ ID:687, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:687 is located at position 21134 relative to the genome of Human coronavirus 229E.

[9771] VGAM701 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM701 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9772] An enzyme complex designated DICER COMPLEX, dices the VGAM701 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM701 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM701 RNA is designated SEQ ID:3412, and is provided hereinbelow with reference to the sequence listing part.

[9773] VGAM701 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM701 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM701 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9774] VGAM701 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM701 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM701 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM701 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM701 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9775] The complementary binding of VGAM701 RNA, herein designated VGAM RNA, to host target binding sites on VGAM701 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM701 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM701 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9776] It is appreciated that VGAM701 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM701 host target genes. The mRNA of each one of this plurality of VGAM701 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM701 RNA, herein designated VGAM

RNA, and which when bound by VGAM701 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM701 host target proteins.

[9777] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM701 gene, herein designated VGAM GENE, on one or more VGAM701 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9778] It is yet further appreciated that a function of VGAM701 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM701 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM701 correlate with, and may be deduced from, the identity of the host target genes which VGAM701 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9779] Nucleotide sequences of the VGAM701 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM701 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM701 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM701 are further described hereinbelow with reference to Table 1.

[9780] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM701 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9781] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 702 (VGAM702) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9782] VGAM702 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM702 was detected is described hereinabove with reference to Figs. 2–8.

[9783] VGAM702 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM702 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9784] VGAM702 gene, herein designated VGAM GENE, encodes a VGAM702 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM702 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM702 precursor RNA is designated SEQ ID:688, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:688 is located at position 22902 relative to

the genome of Human coronavirus 229E.

[9785] VGAM702 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM702 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9786] An enzyme complex designated DICER COMPLEX, dices the VGAM702 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM702 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM702 RNA is designated SEQ ID:3413, and is provided hereinbelow with reference to the sequence listing part.

[9787] VGAM702 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM702 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM702 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9788] VGAM702 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM702 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM702 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM702 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM702 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9789] The complementary binding of VGAM702 RNA, herein designated VGAM RNA, to host target binding sites on VGAM702 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM702 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM702 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9790] It is appreciated that VGAM702 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM702 host target genes. The mRNA of each one of this plurality of VGAM702 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM702 RNA, herein designated VGAM RNA, and which when bound by VGAM702 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM702 host target proteins.

[9791] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM702 gene, herein designated VGAM GENE, on one or more VGAM702 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9792] It is yet further appreciated that a function of VGAM702 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM702 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM702 correlate with, and may be deduced from, the identity of the host target genes which VGAM702 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9793] Nucleotide sequences of the VGAM702 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM702 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM702 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM702 are further described hereinbelow with reference to Table 1.

[9794] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM702 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9795] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 703 (VGAM703) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9796] VGAM703 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM703 was detected is described hereinabove with reference to Figs. 2–8.

[9797] VGAM703 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM703 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9798] VGAM703 gene, herein designated VGAM GENE, encodes a VGAM703 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM703 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM703 precursor RNA is designated SEQ ID:689, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:689 is located at position 22503 relative to the genome of Human coronavirus 229E.

[9799] VGAM703 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM703 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9800] An enzyme complex designated DICER COMPLEX, dices the VGAM703 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM703 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM703 RNA is designated SEQ ID:3414, and is provided hereinbelow with reference to the sequence

listing part.

[9801] VGAM703 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM703 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM703 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9802] VGAM703 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM703 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM703 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM703 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM703 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9803] The complementary binding of VGAM703 RNA, herein designated VGAM RNA, to host target binding sites on VGAM703 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM703 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM703 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9804] It is appreciated that VGAM703 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM703 host target genes. The mRNA of each one of this plurality of VGAM703 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM703 RNA, herein designated VGAM RNA, and which when bound by VGAM703 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM703 host target proteins.

[9805] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM703 gene, herein designated VGAM GENE, on one or more VGAM703 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9806] It is yet further appreciated that a function of VGAM703 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM703 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM703 correlate with, and may be deduced from, the identity of the host target genes which VGAM703 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9807] Nucleotide sequences of the VGAM703 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM703 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM703 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM703 are further described hereinbelow with reference to Table 1.

[9808] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM703 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9809] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 704 (VGAM704) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9810] VGAM704 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM704 was detected is described hereinabove with reference to Figs. 2–8.

[9811] VGAM704 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM704 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9812] VGAM704 gene, herein designated VGAM GENE, encodes a VGAM704 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM704 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM704 precursor RNA is designated SEQ ID:690, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:690 is located at position 21569 relative to the genome of Human coronavirus 229E.

[9813] VGAM704 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM704 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9814] An enzyme complex designated DICER COMPLEX, dices the VGAM704 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM704 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM704 RNA is designated SEQ ID:3415, and

is provided hereinbelow with reference to the sequence listing part.

[9815] VGAM704 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM704 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM704 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9816] VGAM704 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM704 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM704 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM704 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM704 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9817] The complementary binding of VGAM704 RNA, herein designated VGAM RNA, to host target binding sites on VGAM704 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM704 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM704 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9818] It is appreciated that VGAM704 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM704 host target genes. The mRNA of each one of this plurality of VGAM704 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM704 RNA, herein designated VGAM RNA, and which when bound by VGAM704 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM704 host target proteins.

[9819] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM704 gene, herein designated VGAM GENE, on one or more VGAM704 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9820] It is yet further appreciated that a function of VGAM704 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM704 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM704 correlate with, and may be deduced from, the identity of the host target genes which VGAM704 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9821] Nucleotide sequences of the VGAM704 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM704 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM704 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM704 are further described hereinbelow with reference to Table 1.

[9822] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM704 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9823] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 705 (VGAM705) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9824] VGAM705 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM705 was detected is described hereinabove with reference to Figs. 2–8.

[9825] VGAM705 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM705 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9826] VGAM705 gene, herein designated VGAM GENE, encodes a VGAM705 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM705 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM705 precursor RNA is

designated SEQ ID:691, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:691 is located at position 23467 relative to the genome of Human coronavirus 229E.

[9827] VGAM705 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM705 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9828] An enzyme complex designated DICER COMPLEX, dices the VGAM705 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM705 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide se-

quence of VGAM705 RNA is designated SEQ ID:3416, and is provided hereinbelow with reference to the sequence listing part.

[9829] VGAM705 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM705 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM705 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9830] VGAM705 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM705 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM705 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM705 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM705 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9831] The complementary binding of VGAM705 RNA, herein designated VGAM RNA, to host target binding sites on VGAM705 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM705 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM705 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9832] It is appreciated that VGAM705 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM705 host target genes. The mRNA of

each one of this plurality of VGAM705 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM705 RNA, herein designated VGAM RNA, and which when bound by VGAM705 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM705 host target proteins.

[9833] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM705 gene, herein designated VGAM GENE, on one or more VGAM705 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[9834] It is yet further appreciated that a function of VGAM705 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM705 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM705 correlate with, and may be deduced from, the identity of the host target genes which VGAM705 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9835] Nucleotide sequences of the VGAM705 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM705 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM705 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM705 are further described hereinbelow with reference to Table 1.

[9836] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM705 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[9837] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 706 (VGAM706) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9838] VGAM706 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM706 was detected is described hereinabove with reference to Figs. 2–8.

[9839] VGAM706 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM706 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9840] VGAM706 gene, herein designated VGAM GENE, encodes a VGAM706 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM706 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM706 precursor RNA is designated SEQ ID:692, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:692 is located at position 23583 relative to the genome of Human coronavirus 229E.

[9841] VGAM706 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM706 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9842] An enzyme complex designated DICER COMPLEX, dices the VGAM706 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM706 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM706 RNA is designated SEQ ID:3417, and is provided hereinbelow with reference to the sequence listing part.

[9843] VGAM706 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM706 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM706 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9844] VGAM706 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM706 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM706 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM706 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM706 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9845] The complementary binding of VGAM706 RNA, herein designated VGAM RNA, to host target binding sites on VGAM706 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM706 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM706 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9846] It is appreciated that VGAM706 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM706 host target genes. The mRNA of each one of this plurality of VGAM706 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM706 RNA, herein designated VGAM RNA, and which when bound by VGAM706 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM706 host target proteins.

[9847] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM706 gene, herein designated VGAM GENE, on one or more VGAM706 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[9848] It is yet further appreciated that a function of VGAM706 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM706 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E. Specific functions, and accordingly utilities, of VGAM706 correlate with, and may be deduced from, the identity of the host target genes which VGAM706 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9849] Nucleotide sequences of the VGAM706 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM706 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM706 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM706 are further described hereinbelow with reference to Table 1.

[9850] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM706 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9851] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 707 (VGAM707) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9852] VGAM707 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM707 was detected is described hereinabove with reference to Figs. 2–8.

[9853] VGAM707 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate iridescent virus 6. VGAM707 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9854] VGAM707 gene, herein designated VGAM GENE, encodes a VGAM707 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM707 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM707 precursor RNA is designated SEQ ID:693, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:693 is located at position 129865 relative to the genome of Invertebrate iridescent virus 6.

[9855] VGAM707 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM707 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9856] An enzyme complex designated DICER COMPLEX, dices the VGAM707 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM707 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM707 RNA is designated SEQ ID:3418, and is provided hereinbelow with reference to the sequence listing part.

[9857] VGAM707 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM707 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM707 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9858] VGAM707 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM707 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM707 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM707 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM707 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9859] The complementary binding of VGAM707 RNA, herein designated VGAM RNA, to host target binding sites on VGAM707 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM707 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM707 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9860] It is appreciated that VGAM707 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM707 host target genes. The mRNA of each one of this plurality of VGAM707 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM707 RNA, herein designated VGAM RNA, and which when bound by VGAM707 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM707 host target proteins.

[9861] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM707 gene, herein designated VGAM GENE, on one or more VGAM707 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9862] It is yet further appreciated that a function of VGAM707 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM707 include diagnosis, prevention and treatment of viral infection by Invertebrate iridescent virus 6. Specific functions, and accordingly utilities, of VGAM707 correlate with, and may be deduced from, the identity of the host target genes which VGAM707 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9863] Nucleotide sequences of the VGAM707 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM707 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM707 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM707 are further described hereinbelow with reference to Table 1.

[9864] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM707 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9865] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 708 (VGAM708) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9866] VGAM708 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM708 was detected is described hereinabove with reference to Figs. 2–8.

[9867] VGAM708 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato virus V.

VGAM708 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9868] VGAM708 gene, herein designated VGAM GENE, encodes a VGAM708 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM708 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM708 precursor RNA is designated SEQ ID:694, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:694 is located at position 9696 relative to the genome of Potato virus V.

[9869] VGAM708 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM708 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9870] An enzyme complex designated DICER COMPLEX, dices the VGAM708 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM708 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM708 RNA is designated SEQ ID:3419, and is provided hereinbelow with reference to the sequence listing part.

[9871] VGAM708 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM708 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM708 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9872] VGAM708 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM708 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM708 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM708 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM708 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9873] The complementary binding of VGAM708 RNA, herein designated VGAM RNA, to host target binding sites on VGAM708 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM708 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM708 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9874] It is appreciated that VGAM708 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM708 host target genes. The mRNA of each one of this plurality of VGAM708 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM708 RNA, herein designated VGAM RNA, and which when bound by VGAM708 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM708 host target proteins.

[9875] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM708 gene, herein designated VGAM GENE, on one or more VGAM708 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9876] It is yet further appreciated that a function of VGAM708 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM708 include diagnosis, prevention and treatment of viral infection by Potato virus V. Specific functions, and accordingly utilities, of VGAM708 correlate with, and may be deduced from, the identity of the host target genes which VGAM708 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9877] Nucleotide sequences of the VGAM708 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM708 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM708 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM708 are further described hereinbelow with reference to Table 1.

[9878] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM708 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9879] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 709 (VGAM709) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9880] VGAM709 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM709 was detected is described hereinabove with reference to Figs. 2–8.

[9881] VGAM709 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Helicoverpa armigera nuclear polyhedrosis virus. VGAM709 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9882] VGAM709 gene, herein designated VGAM GENE, encodes a VGAM709 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM709 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM709 precursor RNA is designated SEQ ID:695, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:695 is located at position 70255 relative to the genome of Helicoverpa armigera nuclear polyhedrosis virus.

[9883] VGAM709 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM709 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9884] An enzyme complex designated DICER COMPLEX, dices the VGAM709 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM709 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM709 RNA is designated SEQ ID:3420, and is provided hereinbelow with reference to the sequence listing part.

[9885] VGAM709 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM709 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM709 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9886] VGAM709 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM709 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM709 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM709 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM709 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9887] The complementary binding of VGAM709 RNA, herein designated VGAM RNA, to host target binding sites on VGAM709 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM709 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM709 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9888] It is appreciated that VGAM709 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM709 host target genes. The mRNA of each one of this plurality of VGAM709 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM709 RNA, herein designated VGAM RNA, and which when bound by VGAM709 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM709 host target proteins.

[9889] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM709 gene, herein designated VGAM GENE, on one or more VGAM709 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9890] It is yet further appreciated that a function of VGAM709 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM709 include diagnosis, prevention and treatment of viral infection by Helicoverpa armigera nuclear polyhedrosis virus. Specific functions, and accordingly utilities, of VGAM709 correlate with, and may be deduced from, the identity of the host target genes which VGAM709 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9891] Nucleotide sequences of the VGAM709 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM709 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM709 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM709 are further described hereinbelow with reference to Table 1.

[9892] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM709 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9893] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 710 (VGAM710) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9894] VGAM710 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM710 was detected is described hereinabove with reference to Figs. 2-8.

[9895] VGAM710 gene, herein designated VGAM GENE, is a viral gene contained in the genome of pestivirus type 2. VGAM710 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9896] VGAM710 gene, herein designated VGAM GENE, encodes a

VGAM710 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM710 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM710 precursor RNA is designated SEQ ID:696, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:696 is located at position 4562 relative to the genome of pestivirus type 2.

[9897] VGAM710 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM710 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9898] An enzyme complex designated DICER COMPLEX, dices the VGAM710 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM710 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM710 RNA is designated SEQ ID:3421, and is provided hereinbelow with reference to the sequence listing part.

[9899] VGAM710 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM710 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM710 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9900] VGAM710 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM710 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM710 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM710 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM710 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9901] The complementary binding of VGAM710 RNA, herein designated VGAM RNA, to host target binding sites on VGAM710 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM710 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM710 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9902] It is appreciated that VGAM710 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM710 host target genes. The mRNA of each one of this plurality of VGAM710 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM710 RNA, herein designated VGAM RNA, and which when bound by VGAM710 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM710 host target proteins.

[9903] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM710 gene, herein designated VGAM GENE, on one or more VGAM710 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9904] It is yet further appreciated that a function of VGAM710 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM710 include diagnosis, prevention and treatment of viral infection by pestivirus type 2. Specific functions, and accordingly utilities, of VGAM710 correlate with, and may be deduced from, the identity of the host target genes which VGAM710 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9905] Nucleotide sequences of the VGAM710 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM710 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM710 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM710 are further de-

scribed hereinbelow with reference to Table 1.

[9906] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM710 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9907] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 711 (VGAM711) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9908] VGAM711 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM711 was detected is described hereinabove with reference to Figs. 2-8.

[9909] VGAM711 gene, herein designated VGAM GENE, is a viral gene contained in the genome of pestivirus type 2. VGAM711 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9910] VGAM711 gene, herein designated VGAM GENE, encodes a VGAM711 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM711 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM711 precursor RNA is designated SEQ ID:697, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:697 is located at position 2306 relative to the genome of pestivirus type 2.

[9911] VGAM711 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM711 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9912] An enzyme complex designated DICER COMPLEX, dices the VGAM711 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM711 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM711 RNA is designated SEQ ID:3422, and is provided hereinbelow with reference to the sequence listing part.

[9913] VGAM711 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM711 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM711 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9914] VGAM711 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM711 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM711 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM711 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM711 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9915] The complementary binding of VGAM711 RNA, herein designated VGAM RNA, to host target binding sites on VGAM711 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM711 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM711 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9916] It is appreciated that VGAM711 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM711 host target genes. The mRNA of each one of this plurality of VGAM711 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM711 RNA, herein designated VGAM RNA, and which when bound by VGAM711 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM711 host target proteins.

[9917] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM711 gene, herein designated VGAM GENE, on one or more VGAM711 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9918] It is yet further appreciated that a function of VGAM711 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM711 include diagnosis, prevention and treatment of viral infection by pestivirus type 2. Specific functions, and accordingly utilities, of VGAM711 correlate with, and may be deduced from, the identity of the host target genes which VGAM711 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9919] Nucleotide sequences of the VGAM711 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM711 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM711 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM711 are further described hereinbelow with reference to Table 1.

[9920] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM711 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9921] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 712 (VGAM712) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9922] VGAM712 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM712 was detected is described hereinabove with reference to Figs. 2-8.

[9923] VGAM712 gene, herein designated VGAM GENE, is a viral gene contained in the genome of pestivirus type 2. VGAM712 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[9924] VGAM712 gene, herein designated VGAM GENE, encodes a VGAM712 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM712 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM712 precursor RNA is designated SEQ ID:698, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:698 is located at position 2668 relative to the genome of pestivirus type 2.

[9925] VGAM712 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM712 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9926] An enzyme complex designated DICER COMPLEX, dices

the VGAM712 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM712 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM712 RNA is designated SEQ ID:3423, and is provided hereinbelow with reference to the sequence listing part.

[9927] VGAM712 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM712 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM712 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9928] VGAM712 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM712 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM712 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM712 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM712 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9929] The complementary binding of VGAM712 RNA, herein designated VGAM RNA, to host target binding sites on VGAM712 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM712 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM712 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9930] It is appreciated that VGAM712 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM712 host target genes. The mRNA of each one of this plurality of VGAM712 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM712 RNA, herein designated VGAM RNA, and which when bound by VGAM712 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM712 host target proteins.

[9931] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM712 gene, herein designated VGAM GENE, on one or more VGAM712 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9932] It is yet further appreciated that a function of VGAM712 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM712 include diagnosis, prevention and treatment of viral infection by pestivirus type 2. Specific functions, and accordingly utilities, of VGAM712 correlate with, and may be deduced from, the identity of the host target genes which VGAM712 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9933] Nucleotide sequences of the VGAM712 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM712 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM712 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM712 are further described hereinbelow with reference to Table 1.

[9934] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM712 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9935] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 713 (VGAM713) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9936] VGAM713 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM713 was detected is described hereinabove with reference to Figs. 2-8.

[9937] VGAM713 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM713 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[9938] VGAM713 gene, herein designated VGAM GENE, encodes a VGAM713 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM713 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM713 precursor RNA is designated SEQ ID:699, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:699 is located at position 103800 relative to the genome of Bovine herpesvirus 4.

[9939] VGAM713 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM713 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9940] An enzyme complex designated DICER COMPLEX, dices the VGAM713 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM713 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM713 RNA is designated SEQ ID:3424, and is provided hereinbelow with reference to the sequence listing part.

[9941] VGAM713 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM713 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM713 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9942] VGAM713 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM713 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM713 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM713 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM713 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9943] The complementary binding of VGAM713 RNA, herein designated VGAM RNA, to host target binding sites on VGAM713 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM713 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM713 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9944] It is appreciated that VGAM713 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM713 host target genes. The mRNA of each one of this plurality of VGAM713 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM713 RNA, herein designated VGAM RNA, and which when bound by VGAM713 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM713 host target proteins.

[9945] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM713 gene, herein designated VGAM GENE, on one or more VGAM713 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9946] It is yet further appreciated that a function of VGAM713 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM713 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM713 correlate with, and may be deduced from, the identity of the host target genes which VGAM713 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9947] Nucleotide sequences of the VGAM713 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM713 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM713 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM713 are further described hereinbelow with reference to Table 1.

[9948] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM713 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9949] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 714 (VGAM714) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9950] VGAM714 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM714 was detected is described hereinabove with reference to Figs. 2-8.

[9951] VGAM714 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4.

VGAM714 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9952] VGAM714 gene, herein designated VGAM GENE, encodes a VGAM714 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM714 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM714 precursor RNA is designated SEQ ID:700, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:700 is located at position 102811 relative to the genome of Bovine herpesvirus 4.

[9953] VGAM714 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM714 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[9954] An enzyme complex designated DICER COMPLEX, dices the VGAM714 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM714 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM714 RNA is designated SEQ ID:3425, and is provided hereinbelow with reference to the sequence listing part.

[9955] VGAM714 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM714 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM714 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9956] VGAM714 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM714 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM714 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM714 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM714 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9957] The complementary binding of VGAM714 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM714 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM714 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM714 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9958] It is appreciated that VGAM714 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM714 host target genes. The mRNA of each one of this plurality of VGAM714 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM714 RNA, herein designated VGAM RNA, and which when bound by VGAM714 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM714 host target proteins.

[9959] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM714 gene, herein designated VGAM GENE, on one or more VGAM714 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9960] It is yet further appreciated that a function of VGAM714 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM714 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM714 correlate with, and may be deduced from, the identity of the host target genes which VGAM714 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9961] Nucleotide sequences of the VGAM714 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM714 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM714 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM714 are further described hereinbelow with reference to Table 1.

[9962] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM714 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9963] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 715 (VGAM715) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9964] VGAM715 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM715 was detected is described hereinabove with reference to Figs. 2-8.

[9965] VGAM715 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Cercopithecine herpesvirus 7. VGAM715 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9966] VGAM715 gene, herein designated VGAM GENE, encodes a VGAM715 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM715 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM715 precursor RNA is designated SEQ ID:701, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:701 is located at position 36568 relative to the genome of Cercopithecine herpesvirus 7.

[9967] VGAM715 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM715 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9968] An enzyme complex designated DICER COMPLEX, dices the VGAM715 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM715 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM715 RNA is designated SEQ ID:3426, and is provided hereinbelow with reference to the sequence listing part.

[9969] VGAM715 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM715 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM715 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9970] VGAM715 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM715 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM715 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM715 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM715 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9971] The complementary binding of VGAM715 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM715 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM715 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM715 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9972] It is appreciated that VGAM715 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM715 host target genes. The mRNA of each one of this plurality of VGAM715 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM715 RNA, herein designated VGAM RNA, and which when bound by VGAM715 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM715 host target proteins.

[9973] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM715 gene, herein designated VGAM GENE, on one or more VGAM715 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9974] It is yet further appreciated that a function of VGAM715 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM715 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM715 correlate with, and may be deduced from, the identity of the host target genes which VGAM715 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9975] Nucleotide sequences of the VGAM715 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM715 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM715 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM715 are further described hereinbelow with reference to Table 1.

[9976] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM715 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9977] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 716 (VGAM716) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9978] VGAM716 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM716 was detected is described hereinabove with reference to Figs. 2-8.

[9979] VGAM716 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM716 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9980] VGAM716 gene, herein designated VGAM GENE, encodes a VGAM716 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM716 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM716 precursor RNA is designated SEQ ID:702, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:702 is located at position 34593 relative to the genome of Cercopithecine herpesvirus 7.

[9981] VGAM716 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM716 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9982] An enzyme complex designated DICER COMPLEX, dices the VGAM716 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM716 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM716 RNA is designated SEQ ID:3427, and is provided hereinbelow with reference to the sequence listing part.

[9983] VGAM716 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM716 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM716 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[9984] VGAM716 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM716 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM716 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM716 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM716 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[9985] The complementary binding of VGAM716 RNA, herein designated VGAM RNA, to host target binding sites on VGAM716 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM716 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM716 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9986] It is appreciated that VGAM716 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM716 host target genes. The mRNA of each one of this plurality of VGAM716 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM716 RNA, herein designated VGAM RNA, and which when bound by VGAM716 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM716 host target proteins.

[9987] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM716 gene, herein designated VGAM GENE, on one or

more VGAM716 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[9988] It is yet further appreciated that a function of VGAM716 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM716 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM716 correlate with, and may be deduced from, the identity of the host target genes which VGAM716 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9989] Nucleotide sequences of the VGAM716 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM716 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM716 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM716 are further described hereinbelow with reference to Table 1.

[9990] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM716 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9991] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 717 (VGAM717) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9992] VGAM717 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM717 was detected is described

hereinabove with reference to Figs. 2–8.

[9993] VGAM717 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM717 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9994] VGAM717 gene, herein designated VGAM GENE, encodes a VGAM717 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM717 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM717 precursor RNA is designated SEQ ID:703, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:703 is located at position 37440 relative to the genome of Cercopithecine herpesvirus 7.

[9995] VGAM717 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM717 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9996] An enzyme complex designated DICER COMPLEX, dices the VGAM717 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM717 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM717 RNA is designated SEQ ID:3428, and is provided hereinbelow with reference to the sequence listing part.

[9997] VGAM717 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM717 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM717 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[9998] VGAM717 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM717 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM717 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM717 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM717 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[9999] The complementary binding of VGAM717 RNA, herein designated VGAM RNA, to host target binding sites on VGAM717 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM717 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM717 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10000] It is appreciated that VGAM717 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM717 host target genes. The mRNA of each one of this plurality of VGAM717 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM717 RNA, herein designated VGAM RNA, and which when bound by VGAM717 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM717 host target proteins.

[10001] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM717 gene, herein designated VGAM GENE, on one or more VGAM717 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10002] It is yet further appreciated that a function of VGAM717 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM717 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM717 correlate with, and may be deduced from, the identity of the host target genes which VGAM717 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[10003] Nucleotide sequences of the VGAM717 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM717 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM717 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM717 are further described hereinbelow with reference to Table 1.

[10004] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM717 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10005] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 718 (VGAM718) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10006] VGAM718 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM718 was detected is described hereinabove with reference to Figs. 2–8.

[10007] VGAM718 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM718 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10008] VGAM718 gene, herein designated VGAM GENE, encodes a VGAM718 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM718 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM718 precursor RNA is designated SEQ ID:704, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:704 is located at position 39450 relative to the genome of Cercopithecine herpesvirus 7.

[10009] VGAM718 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM718 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10010] An enzyme complex designated DICER COMPLEX, dices the VGAM718 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM718 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM718 RNA is designated SEQ ID:3429, and is provided hereinbelow with reference to the sequence listing part.

[10011] VGAM718 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM718 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM718 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10012] VGAM718 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM718 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM718 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM718 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM718 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10013] The complementary binding of VGAM718 RNA, herein designated VGAM RNA, to host target binding sites on VGAM718 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM718 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM718 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10014] It is appreciated that VGAM718 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM718 host target genes. The mRNA of each one of this plurality of VGAM718 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM718 RNA, herein designated VGAM RNA, and which when bound by VGAM718 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM718 host target proteins.

[10015] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM718 gene, herein designated VGAM GENE, on one or more VGAM718 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10016] It is yet further appreciated that a function of VGAM718 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM718 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM718 correlate with, and may be deduced from, the identity of the host target genes which VGAM718 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10017] Nucleotide sequences of the VGAM718 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM718 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM718 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM718 are further described hereinbelow with reference to Table 1.

[10018] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM718 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10019] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 719 (VGAM719) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10020] VGAM719 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM719 was detected is described hereinabove with reference to Figs. 2–8.

[10021] VGAM719 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus siliculosus virus. VGAM719 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10022] VGAM719 gene, herein designated VGAM GENE, encodes a VGAM719 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM719 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM719 precursor RNA is designated SEQ ID:705, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:705 is located at position 32262 relative to the genome of Ectocarpus siliculosus virus.

[10023] VGAM719 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM719 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10024] An enzyme complex designated DICER COMPLEX, dices the VGAM719 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM719 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM719 RNA is designated SEQ ID:3430, and is provided hereinbelow with reference to the sequence listing part.

[10025] VGAM719 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM719 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM719 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10026] VGAM719 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM719 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM719 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM719 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM719 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10027] The complementary binding of VGAM719 RNA, herein designated VGAM RNA, to host target binding sites on VGAM719 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM719 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM719 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10028] It is appreciated that VGAM719 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM719 host target genes. The mRNA of each one of this plurality of VGAM719 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM719 RNA, herein designated VGAM RNA, and which when bound by VGAM719 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM719 host target proteins.

[10029] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM719 gene, herein designated VGAM GENE, on one or more VGAM719 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10030] It is yet further appreciated that a function of VGAM719 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM719 include diagnosis, prevention and treatment of viral infection by Ectocarpus siliculosus virus. Specific functions, and accordingly utilities, of VGAM719 correlate with, and may be deduced from, the identity of

the host target genes which VGAM719 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10031] Nucleotide sequences of the VGAM719 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM719 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM719 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM719 are further described hereinbelow with reference to Table 1.

[10032] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM719 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10033] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 720 (VGAM720) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10034] VGAM720 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM720 was detected is described hereinabove with reference to Figs. 2–8.

[10035] VGAM720 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectocarpus siliculosus virus. VGAM720 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10036] VGAM720 gene, herein designated VGAM GENE, encodes a VGAM720 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM720 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM720 precursor RNA is designated SEQ ID:706, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:706 is located at position 33937 relative to the genome of Ectocarpus siliculosus virus.

[10037] VGAM720 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM720 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10038] An enzyme complex designated DICER COMPLEX, dices the VGAM720 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM720 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM720 RNA is designated SEQ ID:3431, and is provided hereinbelow with reference to the sequence listing part.

[10039] VGAM720 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM720 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM720 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10040] VGAM720 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM720 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM720 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM720 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM720 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10041] The complementary binding of VGAM720 RNA, herein designated VGAM RNA, to host target binding sites on VGAM720 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM720 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM720 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10042] It is appreciated that VGAM720 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM720 host target genes. The mRNA of each one of this plurality of VGAM720 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM720 RNA, herein designated VGAM RNA, and which when bound by VGAM720 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM720 host target proteins.

[10043] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM720 gene, herein designated VGAM GENE, on one or more VGAM720 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10044] It is yet further appreciated that a function of VGAM720 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM720 include diagnosis, prevention and treatment of viral infection by Ectocarpus siliculosus virus. Specific functions, and accordingly utilities, of VGAM720

correlate with, and may be deduced from, the identity of the host target genes which VGAM720 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10045] Nucleotide sequences of the VGAM720 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM720 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM720 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM720 are further described hereinbelow with reference to Table 1.

[10046] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM720 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10047] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 721 (VGAM721) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[10048] VGAM721 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM721 was detected is described hereinabove with reference to Figs. 2–8.

[10049] VGAM721 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato mosaic virus. VGAM721 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10050] VGAM721 gene, herein designated VGAM GENE, encodes a VGAM721 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM721 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM721 precursor RNA is designated SEQ ID:707, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:707 is located at position 1715 relative to the genome of Tomato mosaic virus.

[10051] VGAM721 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM721 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10052] An enzyme complex designated DICER COMPLEX, dices the VGAM721 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM721 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM721 RNA is designated SEQ ID:3432, and is provided hereinbelow with reference to the sequence listing part.

[10053] VGAM721 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM721 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM721 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10054] VGAM721 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM721 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM721 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM721 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM721 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10055] The complementary binding of VGAM721 RNA, herein designated VGAM RNA, to host target binding sites on VGAM721 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM721 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM721 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10056] It is appreciated that VGAM721 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM721 host target genes. The mRNA of each one of this plurality of VGAM721 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM721 RNA, herein designated VGAM RNA, and which when bound by VGAM721 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM721 host target proteins.

[10057] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM721 gene, herein designated VGAM GENE, on one or more VGAM721 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10058] It is yet further appreciated that a function of VGAM721 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM721 include diagnosis, prevention and treatment of viral infection by Tomato mosaic virus. Spe-

cific functions, and accordingly utilities, of VGAM721 correlate with, and may be deduced from, the identity of the host target genes which VGAM721 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10059] Nucleotide sequences of the VGAM721 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM721 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM721 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM721 are further described hereinbelow with reference to Table 1.

[10060] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM721 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10061] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 722 (VGAM722) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[10062] VGAM722 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM722 was detected is described hereinabove with reference to Figs. 2–8.

[10063] VGAM722 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato mosaic virus. VGAM722 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10064] VGAM722 gene, herein designated VGAM GENE, encodes a VGAM722 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM722 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM722 precursor RNA is designated SEQ ID:708, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:708 is located at position 1585 relative to the genome of Tomato mosaic virus.

[10065] VGAM722 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM722 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10066] An enzyme complex designated DICER COMPLEX, dices the VGAM722 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM722 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM722 RNA is designated SEQ ID:3433, and is provided hereinbelow with reference to the sequence listing part.

[10067] VGAM722 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM722 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM722 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10068] VGAM722 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM722 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM722 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM722 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM722 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10069] The complementary binding of VGAM722 RNA, herein designated VGAM RNA, to host target binding sites on VGAM722 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM722 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM722 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10070] It is appreciated that VGAM722 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM722 host target genes. The mRNA of each one of this plurality of VGAM722 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM722 RNA, herein designated VGAM RNA, and which when bound by VGAM722 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM722 host target proteins.

[10071] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM722 gene, herein designated VGAM GENE, on one or more VGAM722 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10072] It is yet further appreciated that a function of VGAM722 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM722 include diagnosis, prevention and

treatment of viral infection by Tomato mosaic virus. Specific functions, and accordingly utilities, of VGAM722 correlate with, and may be deduced from, the identity of the host target genes which VGAM722 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10073] Nucleotide sequences of the VGAM722 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM722 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM722 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM722 are further described hereinbelow with reference to Table 1.

[10074] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM722 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10075] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 723 (VGAM723) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10076] VGAM723 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM723 was detected is described hereinabove with reference to Figs. 2–8.

[10077] VGAM723 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato mosaic virus. VGAM723 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10078] VGAM723 gene, herein designated VGAM GENE, encodes a VGAM723 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM723 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM723 precursor RNA is designated SEQ ID:709, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:709 is located at position 2545 relative to the genome of Tomato mosaic virus.

[10079] VGAM723 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM723 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10080] An enzyme complex designated DICER COMPLEX, dices the VGAM723 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM723 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM723 RNA is designated SEQ ID:3434, and is provided hereinbelow with reference to the sequence listing part.

[10081] VGAM723 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM723 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM723 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10082] VGAM723 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM723 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM723 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM723 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM723 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10083] The complementary binding of VGAM723 RNA, herein designated VGAM RNA, to host target binding sites on VGAM723 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM723 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM723 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10084] It is appreciated that VGAM723 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM723 host target genes. The mRNA of each one of this plurality of VGAM723 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM723 RNA, herein designated VGAM

RNA, and which when bound by VGAM723 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM723 host target proteins.

[10085] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM723 gene, herein designated VGAM GENE, on one or more VGAM723 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10086] It is yet further appreciated that a function of VGAM723 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM723 include diagnosis, prevention and treatment of viral infection by Tomato mosaic virus. Specific functions, and accordingly utilities, of VGAM723 correlate with, and may be deduced from, the identity of the host target genes which VGAM723 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10087] Nucleotide sequences of the VGAM723 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM723 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM723 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM723 are further described hereinbelow with reference to Table 1.

[10088] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM723 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10089] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 724 (VGAM724) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10090] VGAM724 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM724 was detected is described hereinabove with reference to Figs. 2-8.

[10091] VGAM724 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato mosaic virus. VGAM724 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10092] VGAM724 gene, herein designated VGAM GENE, encodes a VGAM724 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM724 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM724 precursor RNA is designated SEQ ID:710, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:710 is located at position 3312 relative to

the genome of Tomato mosaic virus.

[10093] VGAM724 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM724 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10094] An enzyme complex designated DICER COMPLEX, dices the VGAM724 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM724 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM724 RNA is designated SEQ ID:3435, and is provided hereinbelow with reference to the sequence listing part.

[10095] VGAM724 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM724 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM724 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10096] VGAM724 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM724 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM724 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM724 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM724 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10097] The complementary binding of VGAM724 RNA, herein designated VGAM RNA, to host target binding sites on VGAM724 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM724 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM724 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10098] It is appreciated that VGAM724 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM724 host target genes. The mRNA of each one of this plurality of VGAM724 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM724 RNA, herein designated VGAM RNA, and which when bound by VGAM724 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM724 host target proteins.

[10099] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM724 gene, herein designated VGAM GENE, on one or more VGAM724 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10100] It is yet further appreciated that a function of VGAM724 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM724 include diagnosis, prevention and treatment of viral infection by Tomato mosaic virus. Specific functions, and accordingly utilities, of VGAM724 correlate with, and may be deduced from, the identity of the host target genes which VGAM724 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10101] Nucleotide sequences of the VGAM724 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM724 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM724 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM724 are further described hereinbelow with reference to Table 1.

[10102] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM724 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10103] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 725 (VGAM725) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10104] VGAM725 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM725 was detected is described hereinabove with reference to Figs. 2–8.

[10105] VGAM725 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato mosaic virus. VGAM725 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10106] VGAM725 gene, herein designated VGAM GENE, encodes a VGAM725 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM725 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM725 precursor RNA is designated SEQ ID:711, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:711 is located at position 4413 relative to the genome of Tomato mosaic virus.

[10107] VGAM725 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM725 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10108] An enzyme complex designated DICER COMPLEX, dices the VGAM725 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM725 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM725 RNA is designated SEQ ID:3436, and is provided hereinbelow with reference to the sequence

listing part.

[10109] VGAM725 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM725 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM725 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10110] VGAM725 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM725 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM725 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM725 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM725 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10111] The complementary binding of VGAM725 RNA, herein designated VGAM RNA, to host target binding sites on VGAM725 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM725 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM725 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10112] It is appreciated that VGAM725 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM725 host target genes. The mRNA of each one of this plurality of VGAM725 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM725 RNA, herein designated VGAM RNA, and which when bound by VGAM725 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM725 host target proteins.

[10113] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM725 gene, herein designated VGAM GENE, on one or more VGAM725 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10114] It is yet further appreciated that a function of VGAM725 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM725 include diagnosis, prevention and treatment of viral infection by Tomato mosaic virus. Specific functions, and accordingly utilities, of VGAM725 correlate with, and may be deduced from, the identity of the host target genes which VGAM725 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10115] Nucleotide sequences of the VGAM725 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM725 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM725 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM725 are further described hereinbelow with reference to Table 1.

[10116] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM725 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10117] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 726 (VGAM726) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10118] VGAM726 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM726 was detected is described hereinabove with reference to Figs. 2–8.

[10119] VGAM726 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato mosaic virus. VGAM726 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10120] VGAM726 gene, herein designated VGAM GENE, encodes a VGAM726 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM726 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM726 precursor RNA is designated SEQ ID:712, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:712 is located at position 3315 relative to the genome of Tomato mosaic virus.

[10121] VGAM726 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM726 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10122] An enzyme complex designated DICER COMPLEX, dices the VGAM726 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM726 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM726 RNA is designated SEQ ID:3437, and

is provided hereinbelow with reference to the sequence listing part.

[10123] VGAM726 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM726 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM726 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10124] VGAM726 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM726 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM726 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM726 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM726 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10125] The complementary binding of VGAM726 RNA, herein designated VGAM RNA, to host target binding sites on VGAM726 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM726 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM726 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10126] It is appreciated that VGAM726 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM726 host target genes. The mRNA of each one of this plurality of VGAM726 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM726 RNA, herein designated VGAM RNA, and which when bound by VGAM726 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM726 host target proteins.

[10127] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM726 gene, herein designated VGAM GENE, on one or more VGAM726 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10128] It is yet further appreciated that a function of VGAM726 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM726 include diagnosis, prevention and treatment of viral infection by Tomato mosaic virus. Specific functions, and accordingly utilities, of VGAM726 correlate with, and may be deduced from, the identity of the host target genes which VGAM726 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10129] Nucleotide sequences of the VGAM726 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM726 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM726 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM726 are further described hereinbelow with reference to Table 1.

[10130] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM726 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10131] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 727 (VGAM727) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10132] VGAM727 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM727 was detected is described hereinabove with reference to Figs. 2–8.

[10133] VGAM727 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aconitum latent virus. VGAM727 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10134] VGAM727 gene, herein designated VGAM GENE, encodes a VGAM727 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM727 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM727 precursor RNA is

designated SEQ ID:713, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:713 is located at position 3494 relative to the genome of Aconitum latent virus.

[10135] VGAM727 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM727 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10136] An enzyme complex designated DICER COMPLEX, dices the VGAM727 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM727 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide se-

quence of VGAM727 RNA is designated SEQ ID:3438, and is provided hereinbelow with reference to the sequence listing part.

[10137] VGAM727 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM727 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM727 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10138] VGAM727 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM727 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM727 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM727 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM727 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10139] The complementary binding of VGAM727 RNA, herein designated VGAM RNA, to host target binding sites on VGAM727 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM727 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM727 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10140] It is appreciated that VGAM727 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM727 host target genes. The mRNA of

each one of this plurality of VGAM727 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM727 RNA, herein designated VGAM RNA, and which when bound by VGAM727 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM727 host target proteins.

[10141] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM727 gene, herein designated VGAM GENE, on one or more VGAM727 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[10142] It is yet further appreciated that a function of VGAM727 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM727 include diagnosis, prevention and treatment of viral infection by Aconitum latent virus. Specific functions, and accordingly utilities, of VGAM727 correlate with, and may be deduced from, the identity of the host target genes which VGAM727 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10143] Nucleotide sequences of the VGAM727 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM727 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM727 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM727 are further described hereinbelow with reference to Table 1.

[10144] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM727 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[10145] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 728 (VGAM728) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10146] VGAM728 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM728 was detected is described hereinabove with reference to Figs. 2–8.

[10147] VGAM728 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aconitum latent virus. VGAM728 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10148] VGAM728 gene, herein designated VGAM GENE, encodes a VGAM728 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM728 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM728 precursor RNA is designated SEQ ID:714, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:714 is located at position 3248 relative to the genome of Aconitum latent virus.

[10149] VGAM728 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM728 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10150] An enzyme complex designated DICER COMPLEX, dices the VGAM728 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM728 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM728 RNA is designated SEQ ID:3439, and is provided hereinbelow with reference to the sequence listing part.

[10151] VGAM728 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM728 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM728 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10152] VGAM728 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM728 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM728 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM728 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM728 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10153] The complementary binding of VGAM728 RNA, herein designated VGAM RNA, to host target binding sites on VGAM728 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM728 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM728 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10154] It is appreciated that VGAM728 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM728 host target genes. The mRNA of each one of this plurality of VGAM728 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM728 RNA, herein designated VGAM RNA, and which when bound by VGAM728 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM728 host target proteins.

[10155] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM728 gene, herein designated VGAM GENE, on one or more VGAM728 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[10156] It is yet further appreciated that a function of VGAM728 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM728 include diagnosis, prevention and treatment of viral infection by Aconitum latent virus. Specific functions, and accordingly utilities, of VGAM728 correlate with, and may be deduced from, the identity of the host target genes which VGAM728 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10157] Nucleotide sequences of the VGAM728 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM728 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM728 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM728 are further described hereinbelow with reference to Table 1.

[10158] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM728 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10159] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 729 (VGAM729) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10160] VGAM729 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM729 was detected is described hereinabove with reference to Figs. 2–8.

[10161] VGAM729 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cydia pomonella granulovirus. VGAM729 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10162] VGAM729 gene, herein designated VGAM GENE, encodes a VGAM729 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM729 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM729 precursor RNA is designated SEQ ID:715, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:715 is located at position 72517 relative to the genome of *Cydia pomonella* granulovirus.

[10163] VGAM729 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM729 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10164] An enzyme complex designated DICER COMPLEX, dices the VGAM729 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM729 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM729 RNA is designated SEQ ID:3440, and is provided hereinbelow with reference to the sequence listing part.

[10165] VGAM729 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM729 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM729 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10166] VGAM729 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM729 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM729 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM729 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM729 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10167] The complementary binding of VGAM729 RNA, herein designated VGAM RNA, to host target binding sites on VGAM729 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM729 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM729 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10168] It is appreciated that VGAM729 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM729 host target genes. The mRNA of each one of this plurality of VGAM729 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM729 RNA, herein designated VGAM RNA, and which when bound by VGAM729 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM729 host target proteins.

[10169] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM729 gene, herein designated VGAM GENE, on one or more VGAM729 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10170] It is yet further appreciated that a function of VGAM729 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM729 include diagnosis, prevention and treatment of viral infection by *Cydia pomonella* granulovirus. Specific functions, and accordingly utilities, of VGAM729 correlate with, and may be deduced from, the identity of the host target genes which VGAM729 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10171] Nucleotide sequences of the VGAM729 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM729 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM729 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM729 are further described hereinbelow with reference to Table 1.

[10172] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM729 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10173] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 730 (VGAM730) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10174] VGAM730 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM730 was detected is described hereinabove with reference to Figs. 2–8.

[10175] VGAM730 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Cydia pomonella* granulovirus. VGAM730 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10176] VGAM730 gene, herein designated VGAM GENE, encodes a VGAM730 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM730 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM730 precursor RNA is designated SEQ ID:716, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:716 is located at position 72933 relative to the genome of *Cydia pomonella* granulovirus.

[10177] VGAM730 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM730 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10178] An enzyme complex designated DICER COMPLEX, dices the VGAM730 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM730 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM730 RNA is designated SEQ ID:3441, and is provided hereinbelow with reference to the sequence listing part.

[10179] VGAM730 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM730 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM730 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10180] VGAM730 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM730 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM730 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM730 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM730 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10181] The complementary binding of VGAM730 RNA, herein designated VGAM RNA, to host target binding sites on VGAM730 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM730 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM730 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10182] It is appreciated that VGAM730 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM730 host target genes. The mRNA of each one of this plurality of VGAM730 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM730 RNA, herein designated VGAM RNA, and which when bound by VGAM730 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM730 host target proteins.

[10183] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM730 gene, herein designated VGAM GENE, on one or more VGAM730 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10184] It is yet further appreciated that a function of VGAM730 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM730 include diagnosis, prevention and treatment of viral infection by *Cydia pomonella* granulovirus. Specific functions, and accordingly utilities, of VGAM730 correlate with, and may be deduced from, the identity of the host target genes which VGAM730 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10185] Nucleotide sequences of the VGAM730 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM730 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM730 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM730 are further described hereinbelow with reference to Table 1.

[10186] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM730 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10187] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 731 (VGAM731) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10188] VGAM731 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM731 was detected is described hereinabove with reference to Figs. 2–8.

[10189] VGAM731 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Cydia pomonella* granulovirus. VGAM731 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10190] VGAM731 gene, herein designated VGAM GENE, encodes a VGAM731 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM731 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM731 precursor RNA is designated SEQ ID:717, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:717 is located at position 71312 relative to the genome of *Cydia pomonella* granulovirus.

[10191] VGAM731 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM731 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10192] An enzyme complex designated DICER COMPLEX, dices the VGAM731 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM731 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM731 RNA is designated SEQ ID:3442, and is provided hereinbelow with reference to the sequence listing part.

[10193] VGAM731 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM731 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM731 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10194] VGAM731 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM731 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM731 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM731 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM731 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10195] The complementary binding of VGAM731 RNA, herein designated VGAM RNA, to host target binding sites on VGAM731 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM731 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM731 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[10196] It is appreciated that VGAM731 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM731 host target genes. The mRNA of each one of this plurality of VGAM731 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM731 RNA, herein designated VGAM RNA, and which when bound by VGAM731 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM731 host target proteins.

[10197] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM731 gene, herein designated VGAM GENE, on one or more VGAM731 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10198] It is yet further appreciated that a function of VGAM731 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM731 include diagnosis, prevention and treatment of viral infection by *Cydia pomonella* granulovirus. Specific functions, and accordingly utilities, of VGAM731 correlate with, and may be deduced from, the identity of the host target genes which VGAM731 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10199] Nucleotide sequences of the VGAM731 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM731 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM731 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM731 are further described hereinbelow with reference to Table 1.

[10200] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM731 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10201] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 732 (VGAM732) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10202] VGAM732 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM732 was detected is described hereinabove with reference to Figs. 2-8.

[10203] VGAM732 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cydia pomonella granulovirus. VGAM732 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10204] VGAM732 gene, herein designated VGAM GENE, encodes a VGAM732 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM732 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM732 precursor RNA is designated SEQ ID:718, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:718 is located at position 73500 relative to the genome of *Cydia pomonella* granulovirus.

[10205] VGAM732 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM732 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10206] An enzyme complex designated DICER COMPLEX, dices the VGAM732 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM732 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM732 RNA is designated SEQ ID:3443, and is provided hereinbelow with reference to the sequence listing part.

[10207] VGAM732 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM732 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM732 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10208] VGAM732 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM732 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM732 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM732 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM732 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10209] The complementary binding of VGAM732 RNA, herein designated VGAM RNA, to host target binding sites on VGAM732 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM732 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM732 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10210] It is appreciated that VGAM732 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM732 host target genes. The mRNA of each one of this plurality of VGAM732 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM732 RNA, herein designated VGAM RNA, and which when bound by VGAM732 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM732 host target proteins.

[10211] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM732 gene, herein designated VGAM GENE, on one or

more VGAM732 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10212] It is yet further appreciated that a function of VGAM732 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM732 include diagnosis, prevention and treatment of viral infection by Cydia pomonella granulovirus. Specific functions, and accordingly utilities, of VGAM732 correlate with, and may be deduced from, the identity of the host target genes which VGAM732 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10213] Nucleotide sequences of the VGAM732 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM732 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM732 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM732 are further described hereinbelow with reference to Table 1.

[10214] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM732 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10215] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 733 (VGAM733) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10216] VGAM733 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM733 was detected is described

hereinabove with reference to Figs. 2–8.

[10217] VGAM733 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley yellow mosaic virus. VGAM733 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10218] VGAM733 gene, herein designated VGAM GENE, encodes a VGAM733 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM733 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM733 precursor RNA is designated SEQ ID:719, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:719 is located at position 6830 relative to the genome of Barley yellow mosaic virus.

[10219] VGAM733 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM733 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10220] An enzyme complex designated DICER COMPLEX, dices the VGAM733 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM733 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM733 RNA is designated SEQ ID:3444, and is provided hereinbelow with reference to the sequence listing part.

[10221] VGAM733 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM733 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM733 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10222] VGAM733 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM733 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM733 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM733 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM733 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[10223] The complementary binding of VGAM733 RNA, herein designated VGAM RNA, to host target binding sites on VGAM733 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM733 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM733 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10224] It is appreciated that VGAM733 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM733 host target genes. The mRNA of each one of this plurality of VGAM733 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM733 RNA, herein designated VGAM RNA, and which when bound by VGAM733 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM733 host target proteins.

[10225] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM733 gene, herein designated VGAM GENE, on one or more VGAM733 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10226] It is yet further appreciated that a function of VGAM733 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM733 include diagnosis, prevention and treatment of viral infection by Barley yellow mosaic virus. Specific functions, and accordingly utilities, of VGAM733 correlate with, and may be deduced from, the identity of the host target genes which VGAM733 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[10227] Nucleotide sequences of the VGAM733 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM733 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM733 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM733 are further described hereinbelow with reference to Table 1.

[10228] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM733 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10229] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 734 (VGAM734) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10230] VGAM734 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM734 was detected is described hereinabove with reference to Figs. 2–8.

[10231] VGAM734 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley yellow mosaic virus. VGAM734 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10232] VGAM734 gene, herein designated VGAM GENE, encodes a VGAM734 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM734 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM734 precursor RNA is designated SEQ ID:720, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:720 is located at position 4284 relative to the genome of Barley yellow mosaic virus.

[10233] VGAM734 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM734 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10234] An enzyme complex designated DICER COMPLEX, dices the VGAM734 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM734 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM734 RNA is designated SEQ ID:3445, and is provided hereinbelow with reference to the sequence listing part.

[10235] VGAM734 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM734 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM734 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10236] VGAM734 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM734 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM734 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM734 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM734 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10237] The complementary binding of VGAM734 RNA, herein designated VGAM RNA, to host target binding sites on VGAM734 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM734 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM734 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10238] It is appreciated that VGAM734 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM734 host target genes. The mRNA of each one of this plurality of VGAM734 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM734 RNA, herein designated VGAM RNA, and which when bound by VGAM734 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM734 host target proteins.

[10239] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM734 gene, herein designated VGAM GENE, on one or more VGAM734 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10240] It is yet further appreciated that a function of VGAM734 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM734 include diagnosis, prevention and treatment of viral infection by Barley yellow mosaic virus. Specific functions, and accordingly utilities, of VGAM734 correlate with, and may be deduced from, the identity of the host target genes which VGAM734 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[10241] Nucleotide sequences of the VGAM734 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM734 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM734 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM734 are further described hereinbelow with reference to Table 1.

[10242] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM734 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10243] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 735 (VGAM735) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10244] VGAM735 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM735 was detected is described hereinabove with reference to Figs. 2–8.

[10245] VGAM735 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley yellow mosaic virus. VGAM735 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10246] VGAM735 gene, herein designated VGAM GENE, encodes a VGAM735 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM735 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM735 precursor RNA is designated SEQ ID:721, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:721 is located at position 755 relative to the genome of Barley yellow mosaic virus.

[10247] VGAM735 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM735 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10248] An enzyme complex designated DICER COMPLEX, dices the VGAM735 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM735 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM735 RNA is designated SEQ ID:3446, and is provided hereinbelow with reference to the sequence listing part.

[10249] VGAM735 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM735 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM735 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10250] VGAM735 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM735 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM735 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM735 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM735 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10251] The complementary binding of VGAM735 RNA, herein designated VGAM RNA, to host target binding sites on VGAM735 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM735 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM735 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10252] It is appreciated that VGAM735 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM735 host target genes. The mRNA of each one of this plurality of VGAM735 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM735 RNA, herein designated VGAM RNA, and which when bound by VGAM735 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM735 host target proteins.

[10253] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM735 gene, herein designated VGAM GENE, on one or more VGAM735 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10254] It is yet further appreciated that a function of VGAM735 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM735 include diagnosis, prevention and treatment of viral infection by Barley yellow mosaic virus. Specific functions, and accordingly utilities, of VGAM735 correlate with, and may be deduced from, the identity of

the host target genes which VGAM735 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10255] Nucleotide sequences of the VGAM735 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM735 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM735 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM735 are further described hereinbelow with reference to Table 1.

[10256] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM735 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10257] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 736 (VGAM736) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10258] VGAM736 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM736 was detected is described hereinabove with reference to Figs. 2–8.

[10259] VGAM736 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley yellow mosaic virus. VGAM736 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10260] VGAM736 gene, herein designated VGAM GENE, encodes a VGAM736 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM736 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM736 precursor RNA is designated SEQ ID:722, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:722 is located at position 3609 relative to the genome of Barley yellow mosaic virus.

[10261] VGAM736 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM736 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10262] An enzyme complex designated DICER COMPLEX, dices the VGAM736 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM736 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM736 RNA is designated SEQ ID:3447, and is provided hereinbelow with reference to the sequence listing part.

[10263] VGAM736 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM736 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM736 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10264] VGAM736 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM736 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM736 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM736 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM736 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10265] The complementary binding of VGAM736 RNA, herein designated VGAM RNA, to host target binding sites on VGAM736 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM736 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM736 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10266] It is appreciated that VGAM736 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM736 host target genes. The mRNA of each one of this plurality of VGAM736 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM736 RNA, herein designated VGAM RNA, and which when bound by VGAM736 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM736 host target proteins.

[10267] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM736 gene, herein designated VGAM GENE, on one or more VGAM736 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10268] It is yet further appreciated that a function of VGAM736 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM736 include diagnosis, prevention and treatment of viral infection by Barley yellow mosaic virus. Specific functions, and accordingly utilities, of VGAM736

correlate with, and may be deduced from, the identity of the host target genes which VGAM736 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10269] Nucleotide sequences of the VGAM736 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM736 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM736 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM736 are further described hereinbelow with reference to Table 1.

[10270] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM736 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10271] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 737 (VGAM737) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[10272] VGAM737 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM737 was detected is described hereinabove with reference to Figs. 2–8.

[10273] VGAM737 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley yellow mosaic virus. VGAM737 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10274] VGAM737 gene, herein designated VGAM GENE, encodes a VGAM737 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM737 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM737 precursor RNA is designated SEQ ID:723, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:723 is located at position 2030 relative to the genome of Barley yellow mosaic virus.

[10275] VGAM737 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM737 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10276] An enzyme complex designated DICER COMPLEX, dices the VGAM737 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM737 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM737 RNA is designated SEQ ID:3448, and is provided hereinbelow with reference to the sequence listing part.

[10277] VGAM737 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM737 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM737 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10278] VGAM737 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM737 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM737 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM737 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM737 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10279] The complementary binding of VGAM737 RNA, herein designated VGAM RNA, to host target binding sites on VGAM737 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM737 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM737 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10280] It is appreciated that VGAM737 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM737 host target genes. The mRNA of each one of this plurality of VGAM737 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM737 RNA, herein designated VGAM RNA, and which when bound by VGAM737 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM737 host target proteins.

[10281] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM737 gene, herein designated VGAM GENE, on one or more VGAM737 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10282] It is yet further appreciated that a function of VGAM737 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM737 include diagnosis, prevention and treatment of viral infection by Barley yellow mosaic virus.

Specific functions, and accordingly utilities, of VGAM737 correlate with, and may be deduced from, the identity of the host target genes which VGAM737 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10283] Nucleotide sequences of the VGAM737 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM737 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM737 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM737 are further described hereinbelow with reference to Table 1.

[10284] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM737 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10285] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 738 (VGAM738) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[10286] VGAM738 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM738 was detected is described hereinabove with reference to Figs. 2–8.

[10287] VGAM738 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley yellow mosaic virus. VGAM738 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10288] VGAM738 gene, herein designated VGAM GENE, encodes a VGAM738 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM738 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM738 precursor RNA is designated SEQ ID:724, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:724 is located at position 3974 relative to the genome of Barley yellow mosaic virus.

[10289] VGAM738 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM738 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10290] An enzyme complex designated DICER COMPLEX, dices the VGAM738 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM738 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM738 RNA is designated SEQ ID:3449, and is provided hereinbelow with reference to the sequence listing part.

[10291] VGAM738 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM738 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM738 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10292] VGAM738 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM738 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM738 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM738 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM738 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10293] The complementary binding of VGAM738 RNA, herein designated VGAM RNA, to host target binding sites on VGAM738 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM738 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM738 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10294] It is appreciated that VGAM738 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM738 host target genes. The mRNA of each one of this plurality of VGAM738 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM738 RNA, herein designated VGAM RNA, and which when bound by VGAM738 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM738 host target proteins.

[10295] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM738 gene, herein designated VGAM GENE, on one or more VGAM738 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10296] It is yet further appreciated that a function of VGAM738 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM738 include diagnosis, prevention and

treatment of viral infection by Barley yellow mosaic virus. Specific functions, and accordingly utilities, of VGAM738 correlate with, and may be deduced from, the identity of the host target genes which VGAM738 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10297] Nucleotide sequences of the VGAM738 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM738 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM738 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM738 are further described hereinbelow with reference to Table 1.

[10298] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM738 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10299] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 739 (VGAM739) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10300] VGAM739 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM739 was detected is described hereinabove with reference to Figs. 2–8.

[10301] VGAM739 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura syndrome virus. VGAM739 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10302] VGAM739 gene, herein designated VGAM GENE, encodes a VGAM739 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM739 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM739 precursor RNA is designated SEQ ID:725, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:725 is located at position 4695 relative to the genome of Taura syndrome virus.

[10303] VGAM739 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM739 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10304] An enzyme complex designated DICER COMPLEX, dices the VGAM739 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM739 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM739 RNA is designated SEQ ID:3450, and is provided hereinbelow with reference to the sequence listing part.

[10305] VGAM739 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM739 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM739 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10306] VGAM739 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM739 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM739 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM739 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM739 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10307] The complementary binding of VGAM739 RNA, herein designated VGAM RNA, to host target binding sites on VGAM739 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM739 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM739 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10308] It is appreciated that VGAM739 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM739 host target genes. The mRNA of each one of this plurality of VGAM739 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM739 RNA, herein designated VGAM

RNA, and which when bound by VGAM739 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM739 host target proteins.

[10309] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM739 gene, herein designated VGAM GENE, on one or more VGAM739 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10310] It is yet further appreciated that a function of VGAM739 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM739 include diagnosis, prevention and treatment of viral infection by Taura syndrome virus. Specific functions, and accordingly utilities, of VGAM739 correlate with, and may be deduced from, the identity of the host target genes which VGAM739 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10311] Nucleotide sequences of the VGAM739 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM739 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM739 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM739 are further described hereinbelow with reference to Table 1.

[10312] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM739 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10313] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 740 (VGAM740) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10314] VGAM740 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM740 was detected is described hereinabove with reference to Figs. 2–8.

[10315] VGAM740 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura syndrome virus. VGAM740 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10316] VGAM740 gene, herein designated VGAM GENE, encodes a VGAM740 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM740 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM740 precursor RNA is designated SEQ ID:726, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:726 is located at position 5382 relative to

the genome of Taura syndrome virus.

[10317] VGAM740 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM740 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10318] An enzyme complex designated DICER COMPLEX, dices the VGAM740 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM740 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM740 RNA is designated SEQ ID:3451, and is provided hereinbelow with reference to the sequence listing part.

[10319] VGAM740 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM740 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM740 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10320] VGAM740 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM740 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM740 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM740 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM740 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10321] The complementary binding of VGAM740 RNA, herein designated VGAM RNA, to host target binding sites on VGAM740 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM740 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM740 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10322] It is appreciated that VGAM740 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM740 host target genes. The mRNA of each one of this plurality of VGAM740 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM740 RNA, herein designated VGAM RNA, and which when bound by VGAM740 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM740 host target proteins.

[10323] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM740 gene, herein designated VGAM GENE, on one or more VGAM740 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10324] It is yet further appreciated that a function of VGAM740 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM740 include diagnosis, prevention and treatment of viral infection by Taura syndrome virus. Specific functions, and accordingly utilities, of VGAM740 correlate with, and may be deduced from, the identity of the host target genes which VGAM740 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10325] Nucleotide sequences of the VGAM740 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM740 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM740 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM740 are further described hereinbelow with reference to Table 1.

[10326] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM740 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10327] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 741 (VGAM741) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10328] VGAM741 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM741 was detected is described hereinabove with reference to Figs. 2–8.

[10329] VGAM741 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura syndrome virus. VGAM741 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10330] VGAM741 gene, herein designated VGAM GENE, encodes a VGAM741 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM741 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM741 precursor RNA is designated SEQ ID:727, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:727 is located at position 2942 relative to the genome of Taura syndrome virus.

[10331] VGAM741 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM741 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10332] An enzyme complex designated DICER COMPLEX, dices the VGAM741 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM741 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM741 RNA is designated SEQ ID:3452, and is provided hereinbelow with reference to the sequence

listing part.

[10333] VGAM741 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM741 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM741 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10334] VGAM741 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM741 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM741 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM741 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM741 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10335] The complementary binding of VGAM741 RNA, herein designated VGAM RNA, to host target binding sites on VGAM741 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM741 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM741 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10336] It is appreciated that VGAM741 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM741 host target genes. The mRNA of each one of this plurality of VGAM741 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM741 RNA, herein designated VGAM RNA, and which when bound by VGAM741 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM741 host target proteins.

[10337] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM741 gene, herein designated VGAM GENE, on one or more VGAM741 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10338] It is yet further appreciated that a function of VGAM741 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM741 include diagnosis, prevention and treatment of viral infection by Taura syndrome virus. Specific functions, and accordingly utilities, of VGAM741 correlate with, and may be deduced from, the identity of the host target genes which VGAM741 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10339] Nucleotide sequences of the VGAM741 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM741 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM741 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM741 are further described hereinbelow with reference to Table 1.

[10340] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM741 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10341] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 742 (VGAM742) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10342] VGAM742 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM742 was detected is described hereinabove with reference to Figs. 2–8.

[10343] VGAM742 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura syndrome virus. VGAM742 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10344] VGAM742 gene, herein designated VGAM GENE, encodes a VGAM742 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM742 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM742 precursor RNA is designated SEQ ID:728, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:728 is located at position 1402 relative to the genome of Taura syndrome virus.

[10345] VGAM742 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM742 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10346] An enzyme complex designated DICER COMPLEX, dices the VGAM742 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM742 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM742 RNA is designated SEQ ID:3453, and

is provided hereinbelow with reference to the sequence listing part.

[10347] VGAM742 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM742 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM742 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10348] VGAM742 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM742 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM742 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM742 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM742 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10349] The complementary binding of VGAM742 RNA, herein designated VGAM RNA, to host target binding sites on VGAM742 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM742 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM742 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10350] It is appreciated that VGAM742 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM742 host target genes. The mRNA of each one of this plurality of VGAM742 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM742 RNA, herein designated VGAM RNA, and which when bound by VGAM742 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM742 host target proteins.

[10351] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM742 gene, herein designated VGAM GENE, on one or more VGAM742 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10352] It is yet further appreciated that a function of VGAM742 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM742 include diagnosis, prevention and treatment of viral infection by Taura syndrome virus. Specific functions, and accordingly utilities, of VGAM742 correlate with, and may be deduced from, the identity of the host target genes which VGAM742 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10353] Nucleotide sequences of the VGAM742 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the dived VGAM742 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM742 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM742 are further described hereinbelow with reference to Table 1.

[10354] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM742 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10355] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 743 (VGAM743) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10356] VGAM743 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM743 was detected is described hereinabove with reference to Figs. 2–8.

[10357] VGAM743 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate iridescent virus 6. VGAM743 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10358] VGAM743 gene, herein designated VGAM GENE, encodes a VGAM743 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM743 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM743 precursor RNA is

designated SEQ ID:729, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:729 is located at position 189563 relative to the genome of Invertebrate iridescent virus 6.

[10359] VGAM743 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM743 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10360] An enzyme complex designated DICER COMPLEX, dices the VGAM743 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM743 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide se-

quence of VGAM743 RNA is designated SEQ ID:3454, and is provided hereinbelow with reference to the sequence listing part.

[10361] VGAM743 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM743 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM743 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10362] VGAM743 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM743 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM743 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM743 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM743 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10363] The complementary binding of VGAM743 RNA, herein designated VGAM RNA, to host target binding sites on VGAM743 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM743 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM743 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10364] It is appreciated that VGAM743 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM743 host target genes. The mRNA of

each one of this plurality of VGAM743 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM743 RNA, herein designated VGAM RNA, and which when bound by VGAM743 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM743 host target proteins.

[10365] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM743 gene, herein designated VGAM GENE, on one or more VGAM743 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[10366] It is yet further appreciated that a function of VGAM743 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM743 include diagnosis, prevention and treatment of viral infection by Invertebrate iridescent virus 6. Specific functions, and accordingly utilities, of VGAM743 correlate with, and may be deduced from, the identity of the host target genes which VGAM743 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10367] Nucleotide sequences of the VGAM743 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM743 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM743 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM743 are further described hereinbelow with reference to Table 1.

[10368] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM743 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[10369] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 744 (VGAM744) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10370] VGAM744 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM744 was detected is described hereinabove with reference to Figs. 2–8.

[10371] VGAM744 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM744 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10372] VGAM744 gene, herein designated VGAM GENE, encodes a VGAM744 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM744 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM744 precursor RNA is designated SEQ ID:730, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:730 is located at position 1346 relative to the genome of Bovine coronavirus.

[10373] VGAM744 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM744 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10374] An enzyme complex designated DICER COMPLEX, dices the VGAM744 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM744 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM744 RNA is designated SEQ ID:3455, and is provided hereinbelow with reference to the sequence listing part.

[10375] VGAM744 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM744 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM744 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10376] VGAM744 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM744 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM744 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM744 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM744 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10377] The complementary binding of VGAM744 RNA, herein designated VGAM RNA, to host target binding sites on VGAM744 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM744 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM744 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10378] It is appreciated that VGAM744 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM744 host target genes. The mRNA of each one of this plurality of VGAM744 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM744 RNA, herein designated VGAM RNA, and which when bound by VGAM744 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM744 host target proteins.

[10379] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM744 gene, herein designated VGAM GENE, on one or more VGAM744 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[10380] It is yet further appreciated that a function of VGAM744 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM744 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM744 correlate with, and may be deduced from, the identity of the host target genes which VGAM744 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[10381] Nucleotide sequences of the VGAM744 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM744 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM744 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM744 are further described hereinbelow with reference to Table 1.

[10382] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM744 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10383] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 745 (VGAM745) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10384] VGAM745 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM745 was detected is described hereinabove with reference to Figs. 2–8.

[10385] VGAM745 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM745 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10386] VGAM745 gene, herein designated VGAM GENE, encodes a VGAM745 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM745 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM745 precursor RNA is designated SEQ ID:731, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:731 is located at position 18815 relative to the genome of Bovine coronavirus.

[10387] VGAM745 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM745 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10388] An enzyme complex designated DICER COMPLEX, dices the VGAM745 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM745 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM745 RNA is designated SEQ ID:3456, and is provided hereinbelow with reference to the sequence listing part.

[10389] VGAM745 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM745 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM745 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10390] VGAM745 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM745 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM745 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM745 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM745 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10391] The complementary binding of VGAM745 RNA, herein designated VGAM RNA, to host target binding sites on VGAM745 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM745 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM745 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10392] It is appreciated that VGAM745 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM745 host target genes. The mRNA of each one of this plurality of VGAM745 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM745 RNA, herein designated VGAM RNA, and which when bound by VGAM745 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM745 host target proteins.

[10393] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM745 gene, herein designated VGAM GENE, on one or more VGAM745 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10394] It is yet further appreciated that a function of VGAM745 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM745 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM745 correlate with, and may be deduced from, the identity of the host target genes which VGAM745 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10395] Nucleotide sequences of the VGAM745 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM745 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM745 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM745 are further described hereinbelow with reference to Table 1.

[10396] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM745 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10397] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 746 (VGAM746) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10398] VGAM746 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM746 was detected is described hereinabove with reference to Figs. 2–8.

[10399] VGAM746 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM746 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10400] VGAM746 gene, herein designated VGAM GENE, encodes a VGAM746 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM746 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM746 precursor RNA is designated SEQ ID:732, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:732 is located at position 13256 relative to the genome of Bovine coronavirus.

[10401] VGAM746 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM746 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10402] An enzyme complex designated DICER COMPLEX, dices the VGAM746 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM746 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM746 RNA is designated SEQ ID:3457, and is provided hereinbelow with reference to the sequence listing part.

[10403] VGAM746 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM746 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM746 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10404] VGAM746 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM746 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM746 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM746 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM746 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10405] The complementary binding of VGAM746 RNA, herein designated VGAM RNA, to host target binding sites on VGAM746 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM746 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM746 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10406] It is appreciated that VGAM746 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM746 host target genes. The mRNA of each one of this plurality of VGAM746 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM746 RNA, herein designated VGAM RNA, and which when bound by VGAM746 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM746 host target proteins.

[10407] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM746 gene, herein designated VGAM GENE, on one or more VGAM746 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10408] It is yet further appreciated that a function of VGAM746 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM746 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM746 correlate with, and may be deduced from, the identity of the host target genes which VGAM746 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10409] Nucleotide sequences of the VGAM746 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM746 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM746 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM746 are further described hereinbelow with reference to Table 1.

[10410] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM746 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10411] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 747 (VGAM747) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10412] VGAM747 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM747 was detected is described hereinabove with reference to Figs. 2–8.

[10413] VGAM747 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM747 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10414] VGAM747 gene, herein designated VGAM GENE, encodes a VGAM747 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM747 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM747 precursor RNA is designated SEQ ID:733, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:733 is located at position 1579 relative to the genome of Bovine coronavirus.

[10415] VGAM747 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM747 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10416] An enzyme complex designated DICER COMPLEX, dices the VGAM747 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM747 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM747 RNA is designated SEQ ID:3458, and is provided hereinbelow with reference to the sequence listing part.

[10417] VGAM747 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM747 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM747 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10418] VGAM747 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM747 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM747 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM747 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM747 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10419] The complementary binding of VGAM747 RNA, herein designated VGAM RNA, to host target binding sites on VGAM747 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM747 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM747 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[10420] It is appreciated that VGAM747 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM747 host target genes. The mRNA of each one of this plurality of VGAM747 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM747 RNA, herein designated VGAM RNA, and which when bound by VGAM747 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM747 host target proteins.

[10421] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM747 gene, herein designated VGAM GENE, on one or more VGAM747 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10422] It is yet further appreciated that a function of VGAM747 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM747 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM747 correlate with, and may be deduced from, the identity of the host target genes which VGAM747 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10423] Nucleotide sequences of the VGAM747 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM747 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM747 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM747 are further described hereinbelow with reference to Table 1.

[10424] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM747 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10425] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 748 (VGAM748) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10426] VGAM748 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM748 was detected is described hereinabove with reference to Figs. 2-8.

[10427] VGAM748 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM748 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10428] VGAM748 gene, herein designated VGAM GENE, encodes a VGAM748 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM748 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM748 precursor RNA is designated SEQ ID:734, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:734 is located at position 20531 relative to the genome of Bovine coronavirus.

[10429] VGAM748 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM748 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10430] An enzyme complex designated DICER COMPLEX, dices the VGAM748 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM748 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM748 RNA is designated SEQ ID:3459, and is provided hereinbelow with reference to the sequence listing part.

[10431] VGAM748 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM748 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM748 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10432] VGAM748 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM748 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM748 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM748 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM748 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10433] The complementary binding of VGAM748 RNA, herein designated VGAM RNA, to host target binding sites on VGAM748 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM748 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM748 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10434] It is appreciated that VGAM748 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM748 host target genes. The mRNA of each one of this plurality of VGAM748 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM748 RNA, herein designated VGAM RNA, and which when bound by VGAM748 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM748 host target proteins.

[10435] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM748 gene, herein designated VGAM GENE, on one or more VGAM748 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10436] It is yet further appreciated that a function of VGAM748 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM748 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM748 correlate with, and may be deduced from, the identity of the host target genes which VGAM748 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10437] Nucleotide sequences of the VGAM748 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM748 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM748 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM748 are further described hereinbelow with reference to Table 1.

[10438] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM748 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10439] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 749 (VGAM749) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10440] VGAM749 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM749 was detected is described hereinabove with reference to Figs. 2-8.

[10441] VGAM749 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM749 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10442] VGAM749 gene, herein designated VGAM GENE, encodes a

VGAM749 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM749 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM749 precursor RNA is designated SEQ ID:735, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:735 is located at position 20005 relative to the genome of Bovine coronavirus.

[10443] VGAM749 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM749 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10444] An enzyme complex designated DICER COMPLEX, dices the VGAM749 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM749 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM749 RNA is designated SEQ ID:3460, and is provided hereinbelow with reference to the sequence listing part.

[10445] VGAM749 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM749 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM749 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10446] VGAM749 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM749 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM749 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM749 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM749 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10447] The complementary binding of VGAM749 RNA, herein designated VGAM RNA, to host target binding sites on VGAM749 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM749 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM749 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10448] It is appreciated that VGAM749 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM749 host target genes. The mRNA of each one of this plurality of VGAM749 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM749 RNA, herein designated VGAM RNA, and which when bound by VGAM749 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM749 host target proteins.

[10449] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM749 gene, herein designated VGAM GENE, on one or more VGAM749 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10450] It is yet further appreciated that a function of VGAM749 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM749 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM749 correlate with, and may be deduced from, the identity of the host target genes which VGAM749 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10451] Nucleotide sequences of the VGAM749 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM749 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM749 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM749 are further de-

scribed hereinbelow with reference to Table 1.

[10452] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM749 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10453] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 750 (VGAM750) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10454] VGAM750 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM750 was detected is described hereinabove with reference to Figs. 2-8.

[10455] VGAM750 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM750 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10456] VGAM750 gene, herein designated VGAM GENE, encodes a VGAM750 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM750 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM750 precursor RNA is designated SEQ ID:736, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:736 is located at position 9253 relative to the genome of Bovine coronavirus.

[10457] VGAM750 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM750 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10458] An enzyme complex designated DICER COMPLEX, dices the VGAM750 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM750 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM750 RNA is designated SEQ ID:3461, and is provided hereinbelow with reference to the sequence listing part.

[10459] VGAM750 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM750 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM750 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10460] VGAM750 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM750 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM750 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM750 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM750 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10461] The complementary binding of VGAM750 RNA, herein designated VGAM RNA, to host target binding sites on VGAM750 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM750 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM750 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10462] It is appreciated that VGAM750 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM750 host target genes. The mRNA of each one of this plurality of VGAM750 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM750 RNA, herein designated VGAM RNA, and which when bound by VGAM750 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM750 host target proteins.

[10463] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM750 gene, herein designated VGAM GENE, on one or more VGAM750 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10464] It is yet further appreciated that a function of VGAM750 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM750 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM750 correlate with, and may be deduced from, the identity of the host target genes which VGAM750 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10465] Nucleotide sequences of the VGAM750 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM750 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM750 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM750 are further described hereinbelow with reference to Table 1.

[10466] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM750 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10467] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 751 (VGAM751) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10468] VGAM751 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM751 was detected is described hereinabove with reference to Figs. 2-8.

[10469] VGAM751 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM751 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[10470] VGAM751 gene, herein designated VGAM GENE, encodes a VGAM751 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM751 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM751 precursor RNA is designated SEQ ID:737, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:737 is located at position 17776 relative to the genome of Bovine coronavirus.

[10471] VGAM751 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM751 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10472] An enzyme complex designated DICER COMPLEX, dices

the VGAM751 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM751 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM751 RNA is designated SEQ ID:3462, and is provided hereinbelow with reference to the sequence listing part.

[10473] VGAM751 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM751 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM751 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10474] VGAM751 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM751 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM751 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM751 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM751 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10475] The complementary binding of VGAM751 RNA, herein designated VGAM RNA, to host target binding sites on VGAM751 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM751 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM751 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10476] It is appreciated that VGAM751 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM751 host target genes. The mRNA of each one of this plurality of VGAM751 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM751 RNA, herein designated VGAM RNA, and which when bound by VGAM751 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM751 host target proteins.

[10477] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM751 gene, herein designated VGAM GENE, on one or more VGAM751 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10478] It is yet further appreciated that a function of VGAM751 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM751 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM751 correlate with, and may be deduced from, the identity of the host target genes which VGAM751 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10479] Nucleotide sequences of the VGAM751 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM751 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM751 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM751 are further described hereinbelow with reference to Table 1.

[10480] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM751 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10481] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 752 (VGAM752) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10482] VGAM752 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM752 was detected is described hereinabove with reference to Figs. 2-8.

[10483] VGAM752 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM752 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[10484] VGAM752 gene, herein designated VGAM GENE, encodes a VGAM752 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM752 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM752 precursor RNA is designated SEQ ID:738, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:738 is located at position 18144 relative to the genome of Bovine coronavirus.

[10485] VGAM752 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM752 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10486] An enzyme complex designated DICER COMPLEX, dices the VGAM752 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM752 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM752 RNA is designated SEQ ID:3463, and is provided hereinbelow with reference to the sequence listing part.

[10487] VGAM752 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM752 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM752 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10488] VGAM752 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM752 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM752 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM752 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM752 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10489] The complementary binding of VGAM752 RNA, herein designated VGAM RNA, to host target binding sites on VGAM752 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM752 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM752 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10490] It is appreciated that VGAM752 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM752 host target genes. The mRNA of each one of this plurality of VGAM752 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM752 RNA, herein designated VGAM RNA, and which when bound by VGAM752 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM752 host target proteins.

[10491] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM752 gene, herein designated VGAM GENE, on one or more VGAM752 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10492] It is yet further appreciated that a function of VGAM752 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM752 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM752 correlate with, and may be deduced from, the identity of the host target genes which VGAM752 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10493] Nucleotide sequences of the VGAM752 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM752 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM752 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM752 are further described hereinbelow with reference to Table 1.

[10494] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM752 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10495] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 753 (VGAM753) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10496] VGAM753 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM753 was detected is described hereinabove with reference to Figs. 2-8.

[10497] VGAM753 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus.

VGAM753 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10498] VGAM753 gene, herein designated VGAM GENE, encodes a VGAM753 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM753 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM753 precursor RNA is designated SEQ ID:739, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:739 is located at position 10788 relative to the genome of Bovine coronavirus.

[10499] VGAM753 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM753 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[10500] An enzyme complex designated DICER COMPLEX, dices the VGAM753 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM753 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM753 RNA is designated SEQ ID:3464, and is provided hereinbelow with reference to the sequence listing part.

[10501] VGAM753 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM753 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM753 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10502] VGAM753 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM753 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM753 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM753 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM753 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10503] The complementary binding of VGAM753 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM753 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM753 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM753 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10504] It is appreciated that VGAM753 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM753 host target genes. The mRNA of each one of this plurality of VGAM753 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM753 RNA, herein designated VGAM RNA, and which when bound by VGAM753 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM753 host target proteins.

[10505] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM753 gene, herein designated VGAM GENE, on one or more VGAM753 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10506] It is yet further appreciated that a function of VGAM753 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM753 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM753 correlate with, and may be deduced from, the identity of the host target genes which VGAM753 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10507] Nucleotide sequences of the VGAM753 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM753 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM753 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM753 are further described hereinbelow with reference to Table 1.

[10508] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM753 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10509] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 754 (VGAM754) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10510] VGAM754 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM754 was detected is described hereinabove with reference to Figs. 2-8.

[10511] VGAM754 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Bovine coronavirus. VGAM754 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10512] VGAM754 gene, herein designated VGAM GENE, encodes a VGAM754 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM754 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM754 precursor RNA is designated SEQ ID:740, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:740 is located at position 8401 relative to the genome of Bovine coronavirus.

[10513] VGAM754 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM754 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10514] An enzyme complex designated DICER COMPLEX, dices the VGAM754 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM754 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM754 RNA is designated SEQ ID:3465, and is provided hereinbelow with reference to the sequence listing part.

[10515] VGAM754 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM754 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM754 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10516] VGAM754 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM754 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM754 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM754 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM754 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10517] The complementary binding of VGAM754 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM754 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM754 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM754 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10518] It is appreciated that VGAM754 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM754 host target genes. The mRNA of each one of this plurality of VGAM754 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM754 RNA, herein designated VGAM RNA, and which when bound by VGAM754 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM754 host target proteins.

[10519] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM754 gene, herein designated VGAM GENE, on one or more VGAM754 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10520] It is yet further appreciated that a function of VGAM754 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM754 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM754 correlate with, and may be deduced from, the identity of the host target genes which VGAM754 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10521] Nucleotide sequences of the VGAM754 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM754 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM754 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM754 are further described hereinbelow with reference to Table 1.

[10522] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM754 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10523] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 755 (VGAM755) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10524] VGAM755 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM755 was detected is described hereinabove with reference to Figs. 2-8.

[10525] VGAM755 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus.

VGAM755 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10526] VGAM755 gene, herein designated VGAM GENE, encodes a VGAM755 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM755 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM755 precursor RNA is designated SEQ ID:741, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:741 is located at position 5925 relative to the genome of Bovine coronavirus.

[10527] VGAM755 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM755 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10528] An enzyme complex designated DICER COMPLEX, dices the VGAM755 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM755 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM755 RNA is designated SEQ ID:3466, and is provided hereinbelow with reference to the sequence listing part.

[10529] VGAM755 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM755 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM755 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[10530] VGAM755 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM755 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM755 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM755 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM755 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10531] The complementary binding of VGAM755 RNA, herein designated VGAM RNA, to host target binding sites on VGAM755 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM755 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM755 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10532] It is appreciated that VGAM755 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM755 host target genes. The mRNA of each one of this plurality of VGAM755 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM755 RNA, herein designated VGAM RNA, and which when bound by VGAM755 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM755 host target proteins.

[10533] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM755 gene, herein designated VGAM GENE, on one or

more VGAM755 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10534] It is yet further appreciated that a function of VGAM755 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM755 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM755 correlate with, and may be deduced from, the identity of the host target genes which VGAM755 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10535] Nucleotide sequences of the VGAM755 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM755 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM755 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM755 are further described hereinbelow with reference to Table 1.

[10536] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM755 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10537] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 756 (VGAM756) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10538] VGAM756 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM756 was detected is described

hereinabove with reference to Figs. 2–8.

[10539] VGAM756 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus.

VGAM756 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10540] VGAM756 gene, herein designated VGAM GENE, encodes a VGAM756 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM756 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM756 precursor RNA is designated SEQ ID:742, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:742 is located at position 15954 relative to the genome of Bovine coronavirus.

[10541] VGAM756 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM756 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10542] An enzyme complex designated DICER COMPLEX, dices the VGAM756 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM756 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM756 RNA is designated SEQ ID:3467, and is provided hereinbelow with reference to the sequence listing part.

[10543] VGAM756 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM756 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM756 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10544] VGAM756 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM756 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM756 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM756 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM756 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[10545] The complementary binding of VGAM756 RNA, herein designated VGAM RNA, to host target binding sites on VGAM756 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM756 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM756 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10546] It is appreciated that VGAM756 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM756 host target genes. The mRNA of each one of this plurality of VGAM756 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM756 RNA, herein designated VGAM RNA, and which when bound by VGAM756 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM756 host target proteins.

[10547] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM756 gene, herein designated VGAM GENE, on one or more VGAM756 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10548] It is yet further appreciated that a function of VGAM756 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM756 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM756 correlate with, and may be deduced from, the identity of the host target genes which VGAM756 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

[10549] Nucleotide sequences of the VGAM756 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM756 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM756 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM756 are further described hereinbelow with reference to Table 1.

[10550] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM756 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10551] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 757 (VGAM757) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10552] VGAM757 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM757 was detected is described hereinabove with reference to Figs. 2–8.

[10553] VGAM757 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus.

VGAM757 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10554] VGAM757 gene, herein designated VGAM GENE, encodes a VGAM757 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM757 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM757 precursor RNA is designated SEQ ID:743, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:743 is located at position 378 relative to the genome of Bovine coronavirus.

[10555] VGAM757 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM757 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10556] An enzyme complex designated DICER COMPLEX, dices the VGAM757 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM757 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM757 RNA is designated SEQ ID:3468, and is provided hereinbelow with reference to the sequence listing part.

[10557] VGAM757 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM757 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM757 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10558] VGAM757 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM757 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM757 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM757 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM757 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10559] The complementary binding of VGAM757 RNA, herein designated VGAM RNA, to host target binding sites on VGAM757 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM757 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM757 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10560] It is appreciated that VGAM757 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM757 host target genes. The mRNA of each one of this plurality of VGAM757 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM757 RNA, herein designated VGAM RNA, and which when bound by VGAM757 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM757 host target proteins.

[10561] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM757 gene, herein designated VGAM GENE, on one or more VGAM757 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10562] It is yet further appreciated that a function of VGAM757 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM757 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM757 correlate with, and may be deduced from, the identity of the host target genes which VGAM757 binds and inhibits, and the

function of these host target genes, as elaborated herein—below.

[10563] Nucleotide sequences of the VGAM757 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM757 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM757 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM757 are further described hereinbelow with reference to Table 1.

[10564] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM757 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10565] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 758 (VGAM758) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10566] VGAM758 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM758 was detected is described hereinabove with reference to Figs. 2–8.

[10567] VGAM758 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus.

VGAM758 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10568] VGAM758 gene, herein designated VGAM GENE, encodes a VGAM758 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM758 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM758 precursor RNA is designated SEQ ID:744, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:744 is located at position 14862 relative to the genome of Bovine coronavirus.

[10569] VGAM758 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM758 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10570] An enzyme complex designated DICER COMPLEX, dices the VGAM758 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM758 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM758 RNA is designated SEQ ID:3469, and is provided hereinbelow with reference to the sequence listing part.

[10571] VGAM758 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM758 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM758 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10572] VGAM758 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM758 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM758 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM758 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM758 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10573] The complementary binding of VGAM758 RNA, herein designated VGAM RNA, to host target binding sites on VGAM758 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM758 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM758 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10574] It is appreciated that VGAM758 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM758 host target genes. The mRNA of each one of this plurality of VGAM758 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM758 RNA, herein designated VGAM RNA, and which when bound by VGAM758 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM758 host target proteins.

[10575] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM758 gene, herein designated VGAM GENE, on one or more VGAM758 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10576] It is yet further appreciated that a function of VGAM758 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM758 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM758 correlate with, and may be deduced from, the identity of the host

target genes which VGAM758 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10577] Nucleotide sequences of the VGAM758 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM758 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM758 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM758 are further described hereinbelow with reference to Table 1.

[10578] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM758 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10579] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 759 (VGAM759) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10580] VGAM759 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM759 was detected is described hereinabove with reference to Figs. 2–8.

[10581] VGAM759 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM759 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10582] VGAM759 gene, herein designated VGAM GENE, encodes a VGAM759 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM759 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM759 precursor RNA is designated SEQ ID:745, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:745 is located at position 7762 relative to the genome of Bovine coronavirus.

[10583] VGAM759 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM759 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10584] An enzyme complex designated DICER COMPLEX, dices the VGAM759 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM759 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM759 RNA is designated SEQ ID:3470, and is provided hereinbelow with reference to the sequence listing part.

[10585] VGAM759 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM759 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM759 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10586] VGAM759 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM759 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM759 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM759 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM759 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10587] The complementary binding of VGAM759 RNA, herein designated VGAM RNA, to host target binding sites on VGAM759 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM759 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM759 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10588] It is appreciated that VGAM759 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM759 host target genes. The mRNA of each one of this plurality of VGAM759 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM759 RNA, herein designated VGAM RNA, and which when bound by VGAM759 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM759 host target proteins.

[10589] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM759 gene, herein designated VGAM GENE, on one or more VGAM759 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10590] It is yet further appreciated that a function of VGAM759 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM759 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM759 correlate

with, and may be deduced from, the identity of the host target genes which VGAM759 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10591] Nucleotide sequences of the VGAM759 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM759 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM759 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM759 are further described hereinbelow with reference to Table 1.

[10592] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM759 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10593] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 760 (VGAM760) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[10594] VGAM760 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM760 was detected is described hereinabove with reference to Figs. 2–8.

[10595] VGAM760 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM760 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10596] VGAM760 gene, herein designated VGAM GENE, encodes a VGAM760 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM760 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM760 precursor RNA is designated SEQ ID:746, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:746 is located at position 14942 relative to the genome of Bovine coronavirus.

[10597] VGAM760 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM760 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10598] An enzyme complex designated DICER COMPLEX, dices the VGAM760 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM760 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM760 RNA is designated SEQ ID:3471, and is provided hereinbelow with reference to the sequence listing part.

[10599] VGAM760 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM760 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM760 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10600] VGAM760 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM760 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM760 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM760 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM760 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10601] The complementary binding of VGAM760 RNA, herein designated VGAM RNA, to host target binding sites on VGAM760 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM760 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM760 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10602] It is appreciated that VGAM760 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM760 host target genes. The mRNA of each one of this plurality of VGAM760 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM760 RNA, herein designated VGAM RNA, and which when bound by VGAM760 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM760 host target proteins.

[10603] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM760 gene, herein designated VGAM GENE, on one or more VGAM760 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10604] It is yet further appreciated that a function of VGAM760 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM760 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific

functions, and accordingly utilities, of VGAM760 correlate with, and may be deduced from, the identity of the host target genes which VGAM760 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10605] Nucleotide sequences of the VGAM760 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM760 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM760 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM760 are further described hereinbelow with reference to Table 1.

[10606] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM760 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10607] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 761 (VGAM761) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[10608] VGAM761 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM761 was detected is described hereinabove with reference to Figs. 2–8.

[10609] VGAM761 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM761 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10610] VGAM761 gene, herein designated VGAM GENE, encodes a VGAM761 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM761 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM761 precursor RNA is designated SEQ ID:747, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:747 is located at position 5511 relative to the genome of Bovine coronavirus.

[10611] VGAM761 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM761 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10612] An enzyme complex designated DICER COMPLEX, dices the VGAM761 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM761 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM761 RNA is designated SEQ ID:3472, and is provided hereinbelow with reference to the sequence listing part.

[10613] VGAM761 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM761 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM761 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10614] VGAM761 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM761 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM761 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM761 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM761 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10615] The complementary binding of VGAM761 RNA, herein designated VGAM RNA, to host target binding sites on VGAM761 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM761 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM761 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10616] It is appreciated that VGAM761 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM761 host target genes. The mRNA of each one of this plurality of VGAM761 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM761 RNA, herein designated VGAM RNA, and which when bound by VGAM761 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM761 host target proteins.

[10617] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM761 gene, herein designated VGAM GENE, on one or more VGAM761 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10618] It is yet further appreciated that a function of VGAM761 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM761 include diagnosis, prevention and

treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM761 correlate with, and may be deduced from, the identity of the host target genes which VGAM761 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10619] Nucleotide sequences of the VGAM761 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM761 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM761 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM761 are further described hereinbelow with reference to Table 1.

[10620] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM761 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10621] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 762 (VGAM762) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10622] VGAM762 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM762 was detected is described hereinabove with reference to Figs. 2–8.

[10623] VGAM762 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM762 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10624] VGAM762 gene, herein designated VGAM GENE, encodes a VGAM762 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM762 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM762 precursor RNA is designated SEQ ID:748, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:748 is located at position 3576 relative to the genome of Bovine coronavirus.

[10625] VGAM762 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM762 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10626] An enzyme complex designated DICER COMPLEX, dices the VGAM762 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM762 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM762 RNA is designated SEQ ID:3473, and is provided hereinbelow with reference to the sequence listing part.

[10627] VGAM762 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM762 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM762 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10628] VGAM762 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM762 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM762 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM762 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM762 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10629] The complementary binding of VGAM762 RNA, herein designated VGAM RNA, to host target binding sites on VGAM762 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM762 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM762 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10630] It is appreciated that VGAM762 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM762 host target genes. The mRNA of each one of this plurality of VGAM762 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM762 RNA, herein designated VGAM

RNA, and which when bound by VGAM762 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM762 host target proteins.

[10631] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM762 gene, herein designated VGAM GENE, on one or more VGAM762 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10632] It is yet further appreciated that a function of VGAM762 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM762 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM762 correlate with, and may be deduced from, the identity of the host target genes which VGAM762 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10633] Nucleotide sequences of the VGAM762 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM762 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM762 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM762 are further described hereinbelow with reference to Table 1.

[10634] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM762 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10635] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 763 (VGAM763) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10636] VGAM763 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM763 was detected is described hereinabove with reference to Figs. 2–8.

[10637] VGAM763 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM763 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10638] VGAM763 gene, herein designated VGAM GENE, encodes a VGAM763 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM763 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM763 precursor RNA is designated SEQ ID:749, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:749 is located at position 18582 relative to

the genome of Bovine coronavirus.

[10639] VGAM763 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM763 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10640] An enzyme complex designated DICER COMPLEX, dices the VGAM763 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM763 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM763 RNA is designated SEQ ID:3474, and is provided hereinbelow with reference to the sequence listing part.

[10641] VGAM763 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM763 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM763 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10642] VGAM763 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM763 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM763 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM763 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM763 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10643] The complementary binding of VGAM763 RNA, herein designated VGAM RNA, to host target binding sites on VGAM763 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM763 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM763 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10644] It is appreciated that VGAM763 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM763 host target genes. The mRNA of each one of this plurality of VGAM763 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM763 RNA, herein designated VGAM RNA, and which when bound by VGAM763 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM763 host target proteins.

[10645] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM763 gene, herein designated VGAM GENE, on one or more VGAM763 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10646] It is yet further appreciated that a function of VGAM763 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM763 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM763 correlate with, and may be deduced from, the identity of the host target genes which VGAM763 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10647] Nucleotide sequences of the VGAM763 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM763 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM763 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM763 are further described hereinbelow with reference to Table 1.

[10648] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM763 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10649] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 764 (VGAM764) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10650] VGAM764 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM764 was detected is described hereinabove with reference to Figs. 2–8.

[10651] VGAM764 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM764 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10652] VGAM764 gene, herein designated VGAM GENE, encodes a VGAM764 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM764 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM764 precursor RNA is designated SEQ ID:750, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:750 is located at position 11280 relative to the genome of Bovine coronavirus.

[10653] VGAM764 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM764 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10654] An enzyme complex designated DICER COMPLEX, dices the VGAM764 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM764 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM764 RNA is designated SEQ ID:3475, and is provided hereinbelow with reference to the sequence

listing part.

[10655] VGAM764 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM764 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM764 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10656] VGAM764 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM764 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM764 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM764 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM764 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10657] The complementary binding of VGAM764 RNA, herein designated VGAM RNA, to host target binding sites on VGAM764 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM764 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM764 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10658] It is appreciated that VGAM764 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM764 host target genes. The mRNA of each one of this plurality of VGAM764 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM764 RNA, herein designated VGAM RNA, and which when bound by VGAM764 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM764 host target proteins.

[10659] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM764 gene, herein designated VGAM GENE, on one or more VGAM764 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10660] It is yet further appreciated that a function of VGAM764 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM764 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM764 correlate with, and may be deduced from, the identity of the host target genes which VGAM764 binds and inhibits, and the function of these host target genes, as elaborated herein—below.

[10661] Nucleotide sequences of the VGAM764 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM764 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM764 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM764 are further described hereinbelow with reference to Table 1.

[10662] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM764 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10663] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 765 (VGAM765) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10664] VGAM765 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM765 was detected is described hereinabove with reference to Figs. 2–8.

[10665] VGAM765 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM765 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10666] VGAM765 gene, herein designated VGAM GENE, encodes a VGAM765 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM765 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM765 precursor RNA is designated SEQ ID:751, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:751 is located at position 8100 relative to the genome of Bovine coronavirus.

[10667] VGAM765 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM765 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10668] An enzyme complex designated DICER COMPLEX, dices the VGAM765 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM765 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM765 RNA is designated SEQ ID:3476, and

is provided hereinbelow with reference to the sequence listing part.

[10669] VGAM765 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM765 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM765 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10670] VGAM765 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM765 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM765 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM765 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM765 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10671] The complementary binding of VGAM765 RNA, herein designated VGAM RNA, to host target binding sites on VGAM765 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM765 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM765 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10672] It is appreciated that VGAM765 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM765 host target genes. The mRNA of each one of this plurality of VGAM765 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM765 RNA, herein designated VGAM RNA, and which when bound by VGAM765 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM765 host target proteins.

[10673] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM765 gene, herein designated VGAM GENE, on one or more VGAM765 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10674] It is yet further appreciated that a function of VGAM765 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM765 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM765 correlate with, and may be deduced from, the identity of the host target genes which VGAM765 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10675] Nucleotide sequences of the VGAM765 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM765 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM765 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM765 are further described hereinbelow with reference to Table 1.

[10676] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM765 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10677] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 766 (VGAM766) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10678] VGAM766 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM766 was detected is described hereinabove with reference to Figs. 2–8.

[10679] VGAM766 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM766 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10680] VGAM766 gene, herein designated VGAM GENE, encodes a VGAM766 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM766 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM766 precursor RNA is

designated SEQ ID:752, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:752 is located at position 8663 relative to the genome of Bovine coronavirus.

[10681] VGAM766 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM766 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10682] An enzyme complex designated DICER COMPLEX, dices the VGAM766 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM766 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM766 RNA is designated SEQ ID:3477, and is provided hereinbelow with reference to the sequence listing part.

[10683] VGAM766 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM766 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM766 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10684] VGAM766 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM766 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM766 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM766 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM766 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10685] The complementary binding of VGAM766 RNA, herein designated VGAM RNA, to host target binding sites on VGAM766 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM766 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM766 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10686] It is appreciated that VGAM766 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM766 host target genes. The mRNA of

each one of this plurality of VGAM766 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM766 RNA, herein designated VGAM RNA, and which when bound by VGAM766 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM766 host target proteins.

[10687] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM766 gene, herein designated VGAM GENE, on one or more VGAM766 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[10688] It is yet further appreciated that a function of VGAM766 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM766 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM766 correlate with, and may be deduced from, the identity of the host target genes which VGAM766 binds and inhibits, and the function of these host target genes, as elaborated herein—below.

[10689] Nucleotide sequences of the VGAM766 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM766 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM766 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM766 are further described hereinbelow with reference to Table 1.

[10690] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM766 RNA, herein designated VGAM RNA, are de—

scribed hereinbelow with reference to Table 2.

[10691] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 767 (VGAM767) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10692] VGAM767 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM767 was detected is described hereinabove with reference to Figs. 2–8.

[10693] VGAM767 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM767 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10694] VGAM767 gene, herein designated VGAM GENE, encodes a VGAM767 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM767 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM767 precursor RNA is designated SEQ ID:753, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:753 is located at position 6557 relative to the genome of Bovine coronavirus.

[10695] VGAM767 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM767 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10696] An enzyme complex designated DICER COMPLEX, dices the VGAM767 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM767 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 68%) nucleotide sequence of VGAM767 RNA is designated SEQ ID:3478, and is provided hereinbelow with reference to the sequence listing part.

[10697] VGAM767 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM767 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM767 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10698] VGAM767 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM767 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM767 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM767 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM767 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10699] The complementary binding of VGAM767 RNA, herein designated VGAM RNA, to host target binding sites on VGAM767 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM767 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM767 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10700] It is appreciated that VGAM767 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM767 host target genes. The mRNA of each one of this plurality of VGAM767 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM767 RNA, herein designated VGAM RNA, and which when bound by VGAM767 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM767 host target proteins.

[10701] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM767 gene, herein designated VGAM GENE, on one or more VGAM767 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[10702] It is yet further appreciated that a function of VGAM767 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM767 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM767 correlate with, and may be deduced from, the identity of the host target genes which VGAM767 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[10703] Nucleotide sequences of the VGAM767 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM767 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM767 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM767 are further described hereinbelow with reference to Table 1.

[10704] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM767 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10705] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 768 (VGAM768) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10706] VGAM768 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM768 was detected is described hereinabove with reference to Figs. 2–8.

[10707] VGAM768 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM768 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10708] VGAM768 gene, herein designated VGAM GENE, encodes a VGAM768 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM768 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM768 precursor RNA is designated SEQ ID:754, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:754 is located at position 13125 relative to the genome of Bovine coronavirus.

[10709] VGAM768 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM768 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10710] An enzyme complex designated DICER COMPLEX, dices the VGAM768 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM768 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM768 RNA is designated SEQ ID:3479, and is provided hereinbelow with reference to the sequence listing part.

[10711] VGAM768 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM768 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM768 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10712] VGAM768 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM768 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM768 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM768 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM768 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10713] The complementary binding of VGAM768 RNA, herein designated VGAM RNA, to host target binding sites on VGAM768 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM768 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM768 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10714] It is appreciated that VGAM768 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM768 host target genes. The mRNA of each one of this plurality of VGAM768 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM768 RNA, herein designated VGAM RNA, and which when bound by VGAM768 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM768 host target proteins.

[10715] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM768 gene, herein designated VGAM GENE, on one or more VGAM768 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10716] It is yet further appreciated that a function of VGAM768 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM768 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM768 correlate with, and may be deduced from, the identity of the host target genes which VGAM768 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10717] Nucleotide sequences of the VGAM768 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM768 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM768 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM768 are further described hereinbelow with reference to Table 1.

[10718] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM768 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10719] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 769 (VGAM769) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10720] VGAM769 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM769 was detected is described hereinabove with reference to Figs. 2–8.

[10721] VGAM769 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM769 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10722] VGAM769 gene, herein designated VGAM GENE, encodes a VGAM769 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM769 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM769 precursor RNA is designated SEQ ID:755, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:755 is located at position 16313 relative to the genome of Bovine coronavirus.

[10723] VGAM769 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM769 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10724] An enzyme complex designated DICER COMPLEX, dices the VGAM769 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM769 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM769 RNA is designated SEQ ID:3480, and is provided hereinbelow with reference to the sequence listing part.

[10725] VGAM769 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM769 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM769 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10726] VGAM769 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM769 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM769 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM769 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM769 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10727] The complementary binding of VGAM769 RNA, herein designated VGAM RNA, to host target binding sites on VGAM769 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM769 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM769 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10728] It is appreciated that VGAM769 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM769 host target genes. The mRNA of each one of this plurality of VGAM769 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM769 RNA, herein designated VGAM RNA, and which when bound by VGAM769 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM769 host target proteins.

[10729] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM769 gene, herein designated VGAM GENE, on one or more VGAM769 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10730] It is yet further appreciated that a function of VGAM769 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM769 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM769 correlate with, and may be deduced from, the identity of the host target genes which VGAM769 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10731] Nucleotide sequences of the VGAM769 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM769 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM769 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM769 are further described hereinbelow with reference to Table 1.

[10732] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM769 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10733] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 770 (VGAM770) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10734] VGAM770 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM770 was detected is described hereinabove with reference to Figs. 2–8.

[10735] VGAM770 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM770 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10736] VGAM770 gene, herein designated VGAM GENE, encodes a VGAM770 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM770 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM770 precursor RNA is designated SEQ ID:756, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:756 is located at position 13249 relative to the genome of Bovine coronavirus.

[10737] VGAM770 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM770 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10738] An enzyme complex designated DICER COMPLEX, dices the VGAM770 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM770 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM770 RNA is designated SEQ ID:3481, and is provided hereinbelow with reference to the sequence listing part.

[10739] VGAM770 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM770 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM770 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10740] VGAM770 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM770 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM770 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM770 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM770 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10741] The complementary binding of VGAM770 RNA, herein designated VGAM RNA, to host target binding sites on VGAM770 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM770 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM770 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[10742] It is appreciated that VGAM770 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM770 host target genes. The mRNA of each one of this plurality of VGAM770 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM770 RNA, herein designated VGAM RNA, and which when bound by VGAM770 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM770 host target proteins.

[10743] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM770 gene, herein designated VGAM GENE, on one or more VGAM770 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10744] It is yet further appreciated that a function of VGAM770 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM770 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM770 correlate with, and may be deduced from, the identity of the host target genes which VGAM770 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10745] Nucleotide sequences of the VGAM770 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM770 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM770 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM770 are further described hereinbelow with reference to Table 1.

[10746] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM770 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10747] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 771 (VGAM771) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10748] VGAM771 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM771 was detected is described hereinabove with reference to Figs. 2-8.

[10749] VGAM771 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM771 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10750] VGAM771 gene, herein designated VGAM GENE, encodes a VGAM771 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM771 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM771 precursor RNA is designated SEQ ID:757, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:757 is located at position 25459 relative to the genome of Bovine coronavirus.

[10751] VGAM771 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM771 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10752] An enzyme complex designated DICER COMPLEX, dices the VGAM771 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM771 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM771 RNA is designated SEQ ID:3482, and is provided hereinbelow with reference to the sequence listing part.

[10753] VGAM771 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM771 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM771 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10754] VGAM771 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM771 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM771 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM771 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM771 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10755] The complementary binding of VGAM771 RNA, herein designated VGAM RNA, to host target binding sites on VGAM771 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM771 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM771 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10756] It is appreciated that VGAM771 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM771 host target genes. The mRNA of each one of this plurality of VGAM771 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM771 RNA, herein designated VGAM RNA, and which when bound by VGAM771 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM771 host target proteins.

[10757] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM771 gene, herein designated VGAM GENE, on one or more VGAM771 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10758] It is yet further appreciated that a function of VGAM771 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM771 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM771 correlate with, and may be deduced from, the identity of the host target genes which VGAM771 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10759] Nucleotide sequences of the VGAM771 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM771 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM771 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM771 are further described hereinbelow with reference to Table 1.

[10760] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM771 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10761] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 772 (VGAM772) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10762] VGAM772 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM772 was detected is described hereinabove with reference to Figs. 2-8.

[10763] VGAM772 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM772 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10764] VGAM772 gene, herein designated VGAM GENE, encodes a

VGAM772 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM772 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM772 precursor RNA is designated SEQ ID:758, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:758 is located at position 24433 relative to the genome of Bovine coronavirus.

[10765] VGAM772 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM772 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10766] An enzyme complex designated DICER COMPLEX, dices the VGAM772 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM772 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM772 RNA is designated SEQ ID:3483, and is provided hereinbelow with reference to the sequence listing part.

[10767] VGAM772 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM772 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM772 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10768] VGAM772 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM772 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM772 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM772 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM772 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10769] The complementary binding of VGAM772 RNA, herein designated VGAM RNA, to host target binding sites on VGAM772 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM772 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM772 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10770] It is appreciated that VGAM772 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM772 host target genes. The mRNA of each one of this plurality of VGAM772 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM772 RNA, herein designated VGAM RNA, and which when bound by VGAM772 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM772 host target proteins.

[10771] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM772 gene, herein designated VGAM GENE, on one or more VGAM772 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10772] It is yet further appreciated that a function of VGAM772 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM772 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM772 correlate with, and may be deduced from, the identity of the host target genes which VGAM772 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10773] Nucleotide sequences of the VGAM772 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM772 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM772 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM772 are further de-

scribed hereinbelow with reference to Table 1.

[10774] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM772 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10775] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 773 (VGAM773) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10776] VGAM773 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM773 was detected is described hereinabove with reference to Figs. 2-8.

[10777] VGAM773 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM773 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10778] VGAM773 gene, herein designated VGAM GENE, encodes a VGAM773 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM773 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM773 precursor RNA is designated SEQ ID:759, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:759 is located at position 23974 relative to the genome of Bovine coronavirus.

[10779] VGAM773 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM773 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10780] An enzyme complex designated DICER COMPLEX, dices the VGAM773 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM773 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM773 RNA is designated SEQ ID:3484, and is provided hereinbelow with reference to the sequence listing part.

[10781] VGAM773 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM773 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM773 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10782] VGAM773 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM773 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM773 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM773 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM773 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10783] The complementary binding of VGAM773 RNA, herein designated VGAM RNA, to host target binding sites on VGAM773 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM773 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM773 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10784] It is appreciated that VGAM773 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM773 host target genes. The mRNA of each one of this plurality of VGAM773 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM773 RNA, herein designated VGAM RNA, and which when bound by VGAM773 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM773 host target proteins.

[10785] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM773 gene, herein designated VGAM GENE, on one or more VGAM773 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10786] It is yet further appreciated that a function of VGAM773 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM773 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM773 correlate with, and may be deduced from, the identity of the host target genes which VGAM773 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10787] Nucleotide sequences of the VGAM773 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM773 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM773 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM773 are further described hereinbelow with reference to Table 1.

[10788] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM773 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10789] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 774 (VGAM774) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10790] VGAM774 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM774 was detected is described hereinabove with reference to Figs. 2-8.

[10791] VGAM774 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM774 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[10792] VGAM774 gene, herein designated VGAM GENE, encodes a VGAM774 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM774 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM774 precursor RNA is designated SEQ ID:760, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:760 is located at position 23642 relative to the genome of Bovine coronavirus.

[10793] VGAM774 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM774 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10794] An enzyme complex designated DICER COMPLEX, dices

the VGAM774 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM774 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM774 RNA is designated SEQ ID:3485, and is provided hereinbelow with reference to the sequence listing part.

[10795] VGAM774 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM774 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM774 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10796] VGAM774 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM774 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM774 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM774 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM774 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10797] The complementary binding of VGAM774 RNA, herein designated VGAM RNA, to host target binding sites on VGAM774 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM774 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM774 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10798] It is appreciated that VGAM774 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM774 host target genes. The mRNA of each one of this plurality of VGAM774 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM774 RNA, herein designated VGAM RNA, and which when bound by VGAM774 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM774 host target proteins.

[10799] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM774 gene, herein designated VGAM GENE, on one or more VGAM774 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10800] It is yet further appreciated that a function of VGAM774 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM774 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM774 correlate with, and may be deduced from, the identity of the host target genes which VGAM774 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10801] Nucleotide sequences of the VGAM774 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM774 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM774 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM774 are further described hereinbelow with reference to Table 1.

[10802] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM774 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10803] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 775 (VGAM775) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10804] VGAM775 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM775 was detected is described hereinabove with reference to Figs. 2-8.

[10805] VGAM775 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM775 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[10806] VGAM775 gene, herein designated VGAM GENE, encodes a VGAM775 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM775 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM775 precursor RNA is designated SEQ ID:761, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:761 is located at position 24623 relative to the genome of Bovine coronavirus.

[10807] VGAM775 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM775 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10808] An enzyme complex designated DICER COMPLEX, dices the VGAM775 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM775 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM775 RNA is designated SEQ ID:3486, and is provided hereinbelow with reference to the sequence listing part.

[10809] VGAM775 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM775 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM775 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10810] VGAM775 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM775 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM775 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM775 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM775 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10811] The complementary binding of VGAM775 RNA, herein designated VGAM RNA, to host target binding sites on VGAM775 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM775 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM775 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10812] It is appreciated that VGAM775 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM775 host target genes. The mRNA of each one of this plurality of VGAM775 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM775 RNA, herein designated VGAM RNA, and which when bound by VGAM775 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM775 host target proteins.

[10813] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM775 gene, herein designated VGAM GENE, on one or more VGAM775 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10814] It is yet further appreciated that a function of VGAM775 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM775 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM775 correlate with, and may be deduced from, the identity of the host target genes which VGAM775 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10815] Nucleotide sequences of the VGAM775 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM775 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM775 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM775 are further described hereinbelow with reference to Table 1.

[10816] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM775 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10817] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 776 (VGAM776) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10818] VGAM776 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM776 was detected is described hereinabove with reference to Figs. 2-8.

[10819] VGAM776 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Culex nigripalpus* bac-

ulovirus. VGAM776 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10820] VGAM776 gene, herein designated VGAM GENE, encodes a VGAM776 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM776 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM776 precursor RNA is designated SEQ ID:762, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:762 is located at position 29557 relative to the genome of *Culex nigripalpus* baculovirus.

[10821] VGAM776 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM776 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[10822] An enzyme complex designated DICER COMPLEX, dices the VGAM776 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM776 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM776 RNA is designated SEQ ID:3487, and is provided hereinbelow with reference to the sequence listing part.

[10823] VGAM776 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM776 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM776 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10824] VGAM776 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM776 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM776 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM776 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM776 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10825] The complementary binding of VGAM776 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM776 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM776 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM776 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10826] It is appreciated that VGAM776 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM776 host target genes. The mRNA of each one of this plurality of VGAM776 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM776 RNA, herein designated VGAM RNA, and which when bound by VGAM776 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM776 host target proteins.

[10827] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM776 gene, herein designated VGAM GENE, on one or more VGAM776 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10828] It is yet further appreciated that a function of VGAM776 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM776 include diagnosis, prevention and treatment of viral infection by Culex nigripalpus baculovirus. Specific functions, and accordingly utilities, of VGAM776 correlate with, and may be deduced from, the identity of the host target genes which VGAM776 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10829] Nucleotide sequences of the VGAM776 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM776 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM776 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM776 are further described hereinbelow with reference to Table 1.

[10830] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM776 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10831] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 777 (VGAM777) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10832] VGAM777 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM777 was detected is described hereinabove with reference to Figs. 2-8.

[10833] VGAM777 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of *Culex nigripalpus* baculovirus. VGAM777 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10834] VGAM777 gene, herein designated VGAM GENE, encodes a VGAM777 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM777 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM777 precursor RNA is designated SEQ ID:763, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:763 is located at position 71215 relative to the genome of *Culex nigripalpus* baculovirus.

[10835] VGAM777 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM777 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10836] An enzyme complex designated DICER COMPLEX, dices the VGAM777 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM777 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM777 RNA is designated SEQ ID:3488, and is provided hereinbelow with reference to the sequence listing part.

[10837] VGAM777 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM777 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM777 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10838] VGAM777 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM777 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM777 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM777 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM777 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10839] The complementary binding of VGAM777 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM777 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM777 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM777 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10840] It is appreciated that VGAM777 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM777 host target genes. The mRNA of each one of this plurality of VGAM777 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM777 RNA, herein designated VGAM RNA, and which when bound by VGAM777 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM777 host target proteins.

[10841] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM777 gene, herein designated VGAM GENE, on one or more VGAM777 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10842] It is yet further appreciated that a function of VGAM777 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM777 include diagnosis, prevention and treatment of viral infection by Culex nigripalpus baculovirus. Specific functions, and accordingly utilities, of VGAM777 correlate with, and may be deduced from, the identity of the host target genes which VGAM777 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10843] Nucleotide sequences of the VGAM777 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM777 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM777 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM777 are further described hereinbelow with reference to Table 1.

[10844] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM777 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10845] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 778 (VGAM778) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10846] VGAM778 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM778 was detected is described hereinabove with reference to Figs. 2-8.

[10847] VGAM778 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Culex nigripalpus baculovirus. VGAM778 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10848] VGAM778 gene, herein designated VGAM GENE, encodes a VGAM778 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM778 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM778 precursor RNA is designated SEQ ID:764, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:764 is located at position 84607 relative to the genome of Culex nigripalpus baculovirus.

[10849] VGAM778 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM778 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10850] An enzyme complex designated DICER COMPLEX, dices the VGAM778 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM778 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM778 RNA is designated SEQ ID:3489, and is provided hereinbelow with reference to the sequence listing part.

[10851] VGAM778 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM778 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM778 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and

3UTR respectively.

[10852] VGAM778 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM778 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM778 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM778 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM778 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10853] The complementary binding of VGAM778 RNA, herein designated VGAM RNA, to host target binding sites on VGAM778 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM778 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM778 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10854] It is appreciated that VGAM778 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM778 host target genes. The mRNA of each one of this plurality of VGAM778 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM778 RNA, herein designated VGAM RNA, and which when bound by VGAM778 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM778 host target proteins.

[10855] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM778 gene, herein designated VGAM GENE, on one or

more VGAM778 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10856] It is yet further appreciated that a function of VGAM778 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM778 include diagnosis, prevention and treatment of viral infection by Culex nigripalpus baculovirus. Specific functions, and accordingly utilities, of VGAM778 correlate with, and may be deduced from, the identity of the host target genes which VGAM778 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10857] Nucleotide sequences of the VGAM778 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM778 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM778 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM778 are further described hereinbelow with reference to Table 1.

[10858] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM778 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10859] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 779 (VGAM779) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10860] VGAM779 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM779 was detected is described

hereinabove with reference to Figs. 2–8.

[10861] VGAM779 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Spodoptera litura nucleopolyhedrovirus. VGAM779 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10862] VGAM779 gene, herein designated VGAM GENE, encodes a VGAM779 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM779 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM779 precursor RNA is designated SEQ ID:765, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:765 is located at position 23915 relative to the genome of Spodoptera litura nucleopolyhedrovirus.

[10863] VGAM779 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM779 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10864] An enzyme complex designated DICER COMPLEX, dices the VGAM779 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM779 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM779 RNA is designated SEQ ID:3490, and is provided hereinbelow with reference to the sequence listing part.

[10865] VGAM779 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM779 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM779 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10866] VGAM779 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM779 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM779 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM779 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM779 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[10867] The complementary binding of VGAM779 RNA, herein designated VGAM RNA, to host target binding sites on VGAM779 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM779 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM779 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10868] It is appreciated that VGAM779 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM779 host target genes. The mRNA of each one of this plurality of VGAM779 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM779 RNA, herein designated VGAM RNA, and which when bound by VGAM779 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM779 host target proteins.

[10869] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM779 gene, herein designated VGAM GENE, on one or more VGAM779 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10870] It is yet further appreciated that a function of VGAM779 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM779 include diagnosis, prevention and treatment of viral infection by Spodoptera litura nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM779 correlate with, and may be deduced from, the identity of the host target genes which VGAM779 binds and inhibits, and the function of these

host target genes, as elaborated hereinbelow.

[10871] Nucleotide sequences of the VGAM779 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM779 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM779 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM779 are further described hereinbelow with reference to Table 1.

[10872] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM779 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10873] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 780 (VGAM780) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10874] VGAM780 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM780 was detected is described hereinabove with reference to Figs. 2–8.

[10875] VGAM780 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Spodoptera litura nucleopolyhedrovirus. VGAM780 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10876] VGAM780 gene, herein designated VGAM GENE, encodes a VGAM780 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM780 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM780 precursor RNA is designated SEQ ID:766, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:766 is located at position 95927 relative to the genome of Spodoptera litura nucleopolyhedrovirus.

[10877] VGAM780 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM780 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10878] An enzyme complex designated DICER COMPLEX, dices the VGAM780 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM780 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM780 RNA is designated SEQ ID:3491, and is provided hereinbelow with reference to the sequence listing part.

[10879] VGAM780 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM780 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM780 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10880] VGAM780 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM780 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM780 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM780 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM780 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10881] The complementary binding of VGAM780 RNA, herein designated VGAM RNA, to host target binding sites on VGAM780 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM780 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM780 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10882] It is appreciated that VGAM780 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM780 host target genes. The mRNA of each one of this plurality of VGAM780 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM780 RNA, herein designated VGAM RNA, and which when bound by VGAM780 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM780 host target proteins.

[10883] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM780 gene, herein designated VGAM GENE, on one or more VGAM780 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10884] It is yet further appreciated that a function of VGAM780 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM780 include diagnosis, prevention and treatment of viral infection by Spodoptera litura nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM780 correlate with, and may be deduced from, the identity of the host target genes which

VGAM780 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10885] Nucleotide sequences of the VGAM780 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM780 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM780 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM780 are further described hereinbelow with reference to Table 1.

[10886] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM780 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10887] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 781 (VGAM781) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10888] VGAM781 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM781 was detected is described hereinabove with reference to Figs. 2–8.

[10889] VGAM781 gene, herein designated VGAM GENE, is a viral gene contained in the genome of deer tick virus.

VGAM781 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10890] VGAM781 gene, herein designated VGAM GENE, encodes a VGAM781 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM781 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM781 precursor RNA is designated SEQ ID:767, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:767 is located at position 6107 relative to the genome of deer tick virus.

[10891] VGAM781 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM781 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10892] An enzyme complex designated DICER COMPLEX, dices the VGAM781 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM781 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM781 RNA is designated SEQ ID:3492, and is provided hereinbelow with reference to the sequence listing part.

[10893] VGAM781 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM781 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM781 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10894] VGAM781 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM781 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM781 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM781 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM781 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10895] The complementary binding of VGAM781 RNA, herein designated VGAM RNA, to host target binding sites on VGAM781 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM781 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM781 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10896] It is appreciated that VGAM781 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM781 host target genes. The mRNA of each one of this plurality of VGAM781 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM781 RNA, herein designated VGAM RNA, and which when bound by VGAM781 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM781 host target proteins.

[10897] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM781 gene, herein designated VGAM GENE, on one or more VGAM781 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10898] It is yet further appreciated that a function of VGAM781 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM781 include diagnosis, prevention and treatment of viral infection by deer tick virus. Specific functions, and accordingly utilities, of VGAM781 correlate with, and may be deduced from, the identity of the host

target genes which VGAM781 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10899] Nucleotide sequences of the VGAM781 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM781 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM781 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM781 are further described hereinbelow with reference to Table 1.

[10900] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM781 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10901] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 782 (VGAM782) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10902] VGAM782 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM782 was detected is described hereinabove with reference to Figs. 2–8.

[10903] VGAM782 gene, herein designated VGAM GENE, is a viral gene contained in the genome of deer tick virus.

VGAM782 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10904] VGAM782 gene, herein designated VGAM GENE, encodes a VGAM782 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM782 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM782 precursor RNA is designated SEQ ID:768, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:768 is located at position 4906 relative to the genome of deer tick virus.

[10905] VGAM782 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM782 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10906] An enzyme complex designated DICER COMPLEX, dices the VGAM782 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM782 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM782 RNA is designated SEQ ID:3493, and is provided hereinbelow with reference to the sequence listing part.

[10907] VGAM782 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM782 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM782 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10908] VGAM782 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM782 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM782 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM782 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM782 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10909] The complementary binding of VGAM782 RNA, herein designated VGAM RNA, to host target binding sites on VGAM782 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM782 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM782 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10910] It is appreciated that VGAM782 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM782 host target genes. The mRNA of each one of this plurality of VGAM782 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM782 RNA, herein designated VGAM RNA, and which when bound by VGAM782 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM782 host target proteins.

[10911] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM782 gene, herein designated VGAM GENE, on one or more VGAM782 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10912] It is yet further appreciated that a function of VGAM782 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM782 include diagnosis, prevention and treatment of viral infection by deer tick virus. Specific functions, and accordingly utilities, of VGAM782 correlate

with, and may be deduced from, the identity of the host target genes which VGAM782 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10913] Nucleotide sequences of the VGAM782 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM782 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM782 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM782 are further described hereinbelow with reference to Table 1.

[10914] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM782 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10915] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 783 (VGAM783) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[10916] VGAM783 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM783 was detected is described hereinabove with reference to Figs. 2–8.

[10917] VGAM783 gene, herein designated VGAM GENE, is a viral gene contained in the genome of deer tick virus.

VGAM783 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10918] VGAM783 gene, herein designated VGAM GENE, encodes a VGAM783 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM783 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM783 precursor RNA is designated SEQ ID:769, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:769 is located at position 1240 relative to the genome of deer tick virus.

[10919] VGAM783 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM783 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10920] An enzyme complex designated DICER COMPLEX, dices the VGAM783 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM783 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM783 RNA is designated SEQ ID:3494, and is provided hereinbelow with reference to the sequence listing part.

[10921] VGAM783 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM783 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM783 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10922] VGAM783 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM783 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM783 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM783 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM783 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10923] The complementary binding of VGAM783 RNA, herein designated VGAM RNA, to host target binding sites on VGAM783 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM783 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM783 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10924] It is appreciated that VGAM783 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM783 host target genes. The mRNA of each one of this plurality of VGAM783 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM783 RNA, herein designated VGAM RNA, and which when bound by VGAM783 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM783 host target proteins.

[10925] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM783 gene, herein designated VGAM GENE, on one or more VGAM783 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10926] It is yet further appreciated that a function of VGAM783 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM783 include diagnosis, prevention and treatment of viral infection by deer tick virus. Specific

functions, and accordingly utilities, of VGAM783 correlate with, and may be deduced from, the identity of the host target genes which VGAM783 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10927] Nucleotide sequences of the VGAM783 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM783 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM783 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM783 are further described hereinbelow with reference to Table 1.

[10928] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM783 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10929] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 784 (VGAM784) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[10930] VGAM784 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM784 was detected is described hereinabove with reference to Figs. 2–8.

[10931] VGAM784 gene, herein designated VGAM GENE, is a viral gene contained in the genome of deer tick virus.

VGAM784 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10932] VGAM784 gene, herein designated VGAM GENE, encodes a VGAM784 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM784 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM784 precursor RNA is designated SEQ ID:770, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:770 is located at position 834 relative to the genome of deer tick virus.

[10933] VGAM784 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM784 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10934] An enzyme complex designated DICER COMPLEX, dices the VGAM784 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM784 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM784 RNA is designated SEQ ID:3495, and is provided hereinbelow with reference to the sequence listing part.

[10935] VGAM784 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM784 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM784 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10936] VGAM784 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM784 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM784 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM784 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM784 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10937] The complementary binding of VGAM784 RNA, herein designated VGAM RNA, to host target binding sites on VGAM784 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM784 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM784 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10938] It is appreciated that VGAM784 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM784 host target genes. The mRNA of each one of this plurality of VGAM784 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM784 RNA, herein designated VGAM RNA, and which when bound by VGAM784 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM784 host target proteins.

[10939] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM784 gene, herein designated VGAM GENE, on one or more VGAM784 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10940] It is yet further appreciated that a function of VGAM784 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM784 include diagnosis, prevention and

treatment of viral infection by deer tick virus. Specific functions, and accordingly utilities, of VGAM784 correlate with, and may be deduced from, the identity of the host target genes which VGAM784 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10941] Nucleotide sequences of the VGAM784 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM784 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM784 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM784 are further described hereinbelow with reference to Table 1.

[10942] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM784 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10943] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 785 (VGAM785) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10944] VGAM785 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM785 was detected is described hereinabove with reference to Figs. 2–8.

[10945] VGAM785 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zucchini yellow mosaic virus. VGAM785 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10946] VGAM785 gene, herein designated VGAM GENE, encodes a VGAM785 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM785 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM785 precursor RNA is designated SEQ ID:771, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:771 is located at position 7220 relative to the genome of Zucchini yellow mosaic virus.

[10947] VGAM785 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM785 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10948] An enzyme complex designated DICER COMPLEX, dices the VGAM785 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM785 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM785 RNA is designated SEQ ID:3496, and is provided hereinbelow with reference to the sequence listing part.

[10949] VGAM785 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM785 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM785 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10950] VGAM785 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM785 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM785 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM785 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM785 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10951] The complementary binding of VGAM785 RNA, herein designated VGAM RNA, to host target binding sites on VGAM785 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM785 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM785 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10952] It is appreciated that VGAM785 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM785 host target genes. The mRNA of each one of this plurality of VGAM785 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM785 RNA, herein designated VGAM

RNA, and which when bound by VGAM785 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM785 host target proteins.

[10953] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM785 gene, herein designated VGAM GENE, on one or more VGAM785 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10954] It is yet further appreciated that a function of VGAM785 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM785 include diagnosis, prevention and treatment of viral infection by Zucchini yellow mosaic virus. Specific functions, and accordingly utilities, of VGAM785 correlate with, and may be deduced from, the identity of the host target genes which VGAM785 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10955] Nucleotide sequences of the VGAM785 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM785 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM785 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM785 are further described hereinbelow with reference to Table 1.

[10956] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM785 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10957] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 786 (VGAM786) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10958] VGAM786 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM786 was detected is described hereinabove with reference to Figs. 2-8.

[10959] VGAM786 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zucchini yellow mosaic virus. VGAM786 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10960] VGAM786 gene, herein designated VGAM GENE, encodes a VGAM786 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM786 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM786 precursor RNA is designated SEQ ID:772, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:772 is located at position 8631 relative to

the genome of Zucchini yellow mosaic virus.

[10961] VGAM786 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM786 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10962] An enzyme complex designated DICER COMPLEX, dices the VGAM786 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM786 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM786 RNA is designated SEQ ID:3497, and is provided hereinbelow with reference to the sequence listing part.

[10963] VGAM786 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM786 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM786 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10964] VGAM786 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM786 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM786 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM786 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM786 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10965] The complementary binding of VGAM786 RNA, herein designated VGAM RNA, to host target binding sites on VGAM786 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM786 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM786 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10966] It is appreciated that VGAM786 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM786 host target genes. The mRNA of each one of this plurality of VGAM786 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM786 RNA, herein designated VGAM RNA, and which when bound by VGAM786 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM786 host target proteins.

[10967] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM786 gene, herein designated VGAM GENE, on one or more VGAM786 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10968] It is yet further appreciated that a function of VGAM786 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM786 include diagnosis, prevention and treatment of viral infection by Zucchini yellow mosaic virus. Specific functions, and accordingly utilities, of VGAM786 correlate with, and may be deduced from, the identity of the host target genes which VGAM786 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10969] Nucleotide sequences of the VGAM786 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM786 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM786 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM786 are further described hereinbelow with reference to Table 1.

[10970] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM786 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10971] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 787 (VGAM787) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10972] VGAM787 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM787 was detected is described hereinabove with reference to Figs. 2–8.

[10973] VGAM787 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zucchini yellow mosaic virus. VGAM787 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10974] VGAM787 gene, herein designated VGAM GENE, encodes a VGAM787 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM787 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM787 precursor RNA is designated SEQ ID:773, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:773 is located at position 3152 relative to the genome of Zucchini yellow mosaic virus.

[10975] VGAM787 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM787 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10976] An enzyme complex designated DICER COMPLEX, dices the VGAM787 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM787 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM787 RNA is designated SEQ ID:3498, and is provided hereinbelow with reference to the sequence

listing part.

[10977] VGAM787 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM787 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM787 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10978] VGAM787 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM787 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM787 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM787 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM787 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10979] The complementary binding of VGAM787 RNA, herein designated VGAM RNA, to host target binding sites on VGAM787 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM787 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM787 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10980] It is appreciated that VGAM787 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM787 host target genes. The mRNA of each one of this plurality of VGAM787 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM787 RNA, herein designated VGAM RNA, and which when bound by VGAM787 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM787 host target proteins.

[10981] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM787 gene, herein designated VGAM GENE, on one or more VGAM787 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10982] It is yet further appreciated that a function of VGAM787 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM787 include diagnosis, prevention and treatment of viral infection by Zucchini yellow mosaic virus. Specific functions, and accordingly utilities, of VGAM787 correlate with, and may be deduced from, the identity of the host target genes which VGAM787 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10983] Nucleotide sequences of the VGAM787 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM787 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM787 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM787 are further described hereinbelow with reference to Table 1.

[10984] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM787 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10985] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 788 (VGAM788) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10986] VGAM788 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM788 was detected is described hereinabove with reference to Figs. 2–8.

[10987] VGAM788 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zucchini yellow mosaic virus. VGAM788 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10988] VGAM788 gene, herein designated VGAM GENE, encodes a VGAM788 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM788 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM788 precursor RNA is designated SEQ ID:774, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:774 is located at position 2523 relative to the genome of Zucchini yellow mosaic virus.

[10989] VGAM788 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM788 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10990] An enzyme complex designated DICER COMPLEX, dices the VGAM788 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM788 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM788 RNA is designated SEQ ID:3499, and

is provided hereinbelow with reference to the sequence listing part.

[10991] VGAM788 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM788 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM788 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[10992] VGAM788 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM788 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM788 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM788 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM788 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[10993] The complementary binding of VGAM788 RNA, herein designated VGAM RNA, to host target binding sites on VGAM788 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM788 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM788 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10994] It is appreciated that VGAM788 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM788 host target genes. The mRNA of each one of this plurality of VGAM788 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM788 RNA, herein designated VGAM RNA, and which when bound by VGAM788 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM788 host target proteins.

[10995] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM788 gene, herein designated VGAM GENE, on one or more VGAM788 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[10996] It is yet further appreciated that a function of VGAM788 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM788 include diagnosis, prevention and treatment of viral infection by Zucchini yellow mosaic virus. Specific functions, and accordingly utilities, of VGAM788 correlate with, and may be deduced from, the identity of the host target genes which VGAM788 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10997] Nucleotide sequences of the VGAM788 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM788 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM788 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM788 are further described hereinbelow with reference to Table 1.

[10998] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM788 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10999] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 789 (VGAM789) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11000] VGAM789 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM789 was detected is described hereinabove with reference to Figs. 2–8.

[11001] VGAM789 gene, herein designated VGAM GENE, is a viral gene contained in the genome of shrimp white spot syndrome virus (white spot bacilliform virus). VGAM789 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11002] VGAM789 gene, herein designated VGAM GENE, encodes a VGAM789 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM789 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM789 precursor RNA is

designated SEQ ID:775, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:775 is located at position 4478 relative to the genome of shrimp white spot syndrome virus (white spot bacilliform virus).

[11003] VGAM789 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM789 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11004] An enzyme complex designated DICER COMPLEX, dices the VGAM789 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM789 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 44%) nucleotide sequence of VGAM789 RNA is designated SEQ ID:3500, and is provided hereinbelow with reference to the sequence listing part.

[11005] VGAM789 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM789 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM789 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11006] VGAM789 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM789 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM789 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM789 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM789 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11007] The complementary binding of VGAM789 RNA, herein designated VGAM RNA, to host target binding sites on VGAM789 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM789 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM789 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11008] It is appreciated that VGAM789 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM789 host target genes. The mRNA of each one of this plurality of VGAM789 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM789 RNA, herein designated VGAM RNA, and which when bound by VGAM789 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM789 host target proteins.

[11009] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM789 gene, herein designated VGAM GENE, on one or more VGAM789 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[11010] It is yet further appreciated that a function of VGAM789 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM789 include diagnosis, prevention and treatment of viral infection by shrimp white spot syndrome virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM789 correlate with, and may be deduced from, the identity of the host target genes which VGAM789 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11011] Nucleotide sequences of the VGAM789 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM789 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM789 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM789 are further described hereinbelow with reference to Table 1.

[11012] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM789 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11013] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 790 (VGAM790) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11014] VGAM790 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM790 was detected is described hereinabove with reference to Figs. 2–8.

[11015] VGAM790 gene, herein designated VGAM GENE, is a viral gene contained in the genome of shrimp white spot syndrome virus (white spot bacilliform virus). VGAM790 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11016] VGAM790 gene, herein designated VGAM GENE, encodes a VGAM790 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM790 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM790 precursor RNA is designated SEQ ID:776, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:776 is located at position 5279 relative to the genome of shrimp white spot syndrome virus (white spot bacilliform virus).

[11017] VGAM790 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM790 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11018] An enzyme complex designated DICER COMPLEX, dices the VGAM790 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM790 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM790 RNA is designated SEQ ID:3501, and is provided hereinbelow with reference to the sequence listing part.

[11019] VGAM790 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM790 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM790 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11020] VGAM790 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM790 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM790 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM790 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM790 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11021] The complementary binding of VGAM790 RNA, herein designated VGAM RNA, to host target binding sites on VGAM790 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM790 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM790 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[11022] It is appreciated that VGAM790 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM790 host target genes. The mRNA of each one of this plurality of VGAM790 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM790 RNA, herein designated VGAM RNA, and which when bound by VGAM790 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM790 host target proteins.

[11023] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM790 gene, herein designated VGAM GENE, on one or more VGAM790 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11024] It is yet further appreciated that a function of VGAM790 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM790 include diagnosis, prevention and treatment of viral infection by shrimp white spot syndrome virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM790 correlate with, and may be deduced from, the identity of the host target genes which VGAM790 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11025] Nucleotide sequences of the VGAM790 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM790 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM790 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM790 are further described hereinbelow with reference to Table 1.

[11026] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM790 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11027] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 791 (VGAM791) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11028] VGAM791 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM791 was detected is described hereinabove with reference to Figs. 2-8.

[11029] VGAM791 gene, herein designated VGAM GENE, is a viral gene contained in the genome of shrimp white spot syndrome virus (white spot bacilliform virus). VGAM791 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11030] VGAM791 gene, herein designated VGAM GENE, encodes a

VGAM791 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM791 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM791 precursor RNA is designated SEQ ID:777, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:777 is located at position 6245 relative to the genome of shrimp white spot syndrome virus (white spot bacilliform virus).

[11031] VGAM791 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM791 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11032] An enzyme complex designated DICER COMPLEX, dices the VGAM791 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM791 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM791 RNA is designated SEQ ID:3502, and is provided hereinbelow with reference to the sequence listing part.

[11033] VGAM791 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM791 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM791 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11034] VGAM791 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM791 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM791 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM791 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM791 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11035] The complementary binding of VGAM791 RNA, herein designated VGAM RNA, to host target binding sites on VGAM791 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM791 host tar-

get RNA, herein designated VGAM HOST TARGET RNA, into VGAM791 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11036] It is appreciated that VGAM791 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM791 host target genes. The mRNA of each one of this plurality of VGAM791 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM791 RNA, herein designated VGAM RNA, and which when bound by VGAM791 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM791 host target proteins.

[11037] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM791 gene, herein designated VGAM GENE, on one or more VGAM791 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11038] It is yet further appreciated that a function of VGAM791 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM791 include diagnosis, prevention and treatment of viral infection by shrimp white spot syndrome virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM791 correlate with, and may be deduced from, the identity of the host target genes which VGAM791 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11039] Nucleotide sequences of the VGAM791 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM791 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM791 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM791 are further described hereinbelow with reference to Table 1.

[11040] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM791 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11041] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 792 (VGAM792) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11042] VGAM792 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM792 was detected is described hereinabove with reference to Figs. 2-8.

[11043] VGAM792 gene, herein designated VGAM GENE, is a viral gene contained in the genome of shrimp white spot syndrome virus (white spot bacilliform virus). VGAM792 host

target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11044] VGAM792 gene, herein designated VGAM GENE, encodes a VGAM792 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM792 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM792 precursor RNA is designated SEQ ID:778, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:778 is located at position 13192 relative to the genome of shrimp white spot syndrome virus (white spot bacilliform virus).

[11045] VGAM792 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM792 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[11046] An enzyme complex designated DICER COMPLEX, dices the VGAM792 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM792 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM792 RNA is designated SEQ ID:3503, and is provided hereinbelow with reference to the sequence listing part.

[11047] VGAM792 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM792 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM792 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11048] VGAM792 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM792 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM792 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM792 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM792 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11049] The complementary binding of VGAM792 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM792 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM792 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM792 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11050] It is appreciated that VGAM792 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM792 host target genes. The mRNA of each one of this plurality of VGAM792 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM792 RNA, herein designated VGAM RNA, and which when bound by VGAM792 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM792 host target proteins.

[11051] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM792 gene, herein designated VGAM GENE, on one or more VGAM792 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11052] It is yet further appreciated that a function of VGAM792 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM792 include diagnosis, prevention and treatment of viral infection by shrimp white spot syndrome virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM792 correlate with, and may be deduced from, the identity of the host target genes which VGAM792 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11053] Nucleotide sequences of the VGAM792 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM792 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM792 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM792 are further described hereinbelow with reference to Table 1.

[11054] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM792 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11055] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 793 (VGAM793) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11056] VGAM793 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM793 was detected is described hereinabove with reference to Figs. 2-8.

[11057] VGAM793 gene, herein designated VGAM GENE, is a viral gene contained in the genome of shrimp white spot syndrome virus (white spot bacilliform virus). VGAM793 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11058] VGAM793 gene, herein designated VGAM GENE, encodes a VGAM793 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM793 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM793 precursor RNA is designated SEQ ID:779, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:779 is located at position 10748 relative to the genome of shrimp white spot syndrome virus (white spot bacilliform virus).

[11059] VGAM793 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM793 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11060] An enzyme complex designated DICER COMPLEX, dices the VGAM793 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM793 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM793 RNA is designated SEQ ID:3504, and is provided hereinbelow with reference to the sequence listing part.

[11061] VGAM793 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM793 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM793 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11062] VGAM793 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM793 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM793 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM793 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM793 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[11063] The complementary binding of VGAM793 RNA, herein designated VGAM RNA, to host target binding sites on VGAM793 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM793 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM793 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11064] It is appreciated that VGAM793 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM793 host target genes. The mRNA of each one of this plurality of VGAM793 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM793 RNA, herein designated VGAM RNA, and which when bound by VGAM793 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM793 host target proteins.

[11065] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM793 gene, herein designated VGAM GENE, on one or more VGAM793 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11066] It is yet further appreciated that a function of VGAM793 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM793 include diagnosis, prevention and treatment of viral infection by shrimp white spot syndrome virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM793 correlate with, and may be deduced from, the identity of the host target genes which VGAM793 binds and inhibits, and the

function of these host target genes, as elaborated herein—below.

[11067] Nucleotide sequences of the VGAM793 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM793 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM793 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM793 are further described hereinbelow with reference to Table 1.

[11068] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM793 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11069] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 794 (VGAM794) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11070] VGAM794 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM794 was detected is described hereinabove with reference to Figs. 2–8.

[11071] VGAM794 gene, herein designated VGAM GENE, is a viral gene contained in the genome of shrimp white spot syndrome virus (white spot bacilliform virus). VGAM794 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11072] VGAM794 gene, herein designated VGAM GENE, encodes a VGAM794 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM794 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM794 precursor RNA is designated SEQ ID:780, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:780 is located at position 80483 relative to the genome of shrimp white spot syndrome virus (white spot bacilliform virus).

[11073] VGAM794 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM794 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11074] An enzyme complex designated DICER COMPLEX, dices the VGAM794 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM794 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM794 RNA is designated SEQ ID:3505, and is provided hereinbelow with reference to the sequence listing part.

[11075] VGAM794 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM794 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM794 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11076] VGAM794 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM794 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM794 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM794 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM794 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11077] The complementary binding of VGAM794 RNA, herein designated VGAM RNA, to host target binding sites on VGAM794 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM794 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM794 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11078] It is appreciated that VGAM794 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM794 host target genes. The mRNA of each one of this plurality of VGAM794 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM794 RNA, herein designated VGAM RNA, and which when bound by VGAM794 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM794 host target proteins.

[11079] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM794 gene, herein designated VGAM GENE, on one or more VGAM794 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11080] It is yet further appreciated that a function of VGAM794 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM794 include diagnosis, prevention and treatment of viral infection by shrimp white spot syndrome virus (white spot bacilliform virus). Specific func-

tions, and accordingly utilities, of VGAM794 correlate with, and may be deduced from, the identity of the host target genes which VGAM794 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11081] Nucleotide sequences of the VGAM794 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM794 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM794 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM794 are further described hereinbelow with reference to Table 1.

[11082] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM794 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11083] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 795 (VGAM795) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[11084] VGAM795 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM795 was detected is described hereinabove with reference to Figs. 2–8.

[11085] VGAM795 gene, herein designated VGAM GENE, is a viral gene contained in the genome of shrimp white spot syndrome virus (white spot bacilliform virus). VGAM795 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11086] VGAM795 gene, herein designated VGAM GENE, encodes a VGAM795 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM795 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM795 precursor RNA is designated SEQ ID:781, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:781 is located at position 88141 relative to the genome of shrimp white spot syndrome virus (white spot bacilliform virus).

[11087] VGAM795 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM795 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11088] An enzyme complex designated DICER COMPLEX, dices the VGAM795 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM795 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM795 RNA is designated SEQ ID:3506, and is provided hereinbelow with reference to the sequence listing part.

[11089] VGAM795 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM795 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM795 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11090] VGAM795 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM795 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM795 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM795 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM795 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11091] The complementary binding of VGAM795 RNA, herein designated VGAM RNA, to host target binding sites on VGAM795 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM795 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM795 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11092] It is appreciated that VGAM795 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM795 host target genes. The mRNA of each one of this plurality of VGAM795 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM795 RNA, herein designated VGAM

RNA, and which when bound by VGAM795 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM795 host target proteins.

[11093] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM795 gene, herein designated VGAM GENE, on one or more VGAM795 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11094] It is yet further appreciated that a function of VGAM795 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM795 include diagnosis, prevention and treatment of viral infection by shrimp white spot syndrome virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM795 correlate with, and may be deduced from, the identity of the host target genes which VGAM795 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11095] Nucleotide sequences of the VGAM795 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM795 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM795 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM795 are further described hereinbelow with reference to Table 1.

[11096] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM795 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11097] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 796 (VGAM796) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11098] VGAM796 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM796 was detected is described hereinabove with reference to Figs. 2–8.

[11099] VGAM796 gene, herein designated VGAM GENE, is a viral gene contained in the genome of shrimp white spot syndrome virus (white spot bacilliform virus). VGAM796 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11100] VGAM796 gene, herein designated VGAM GENE, encodes a VGAM796 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM796 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM796 precursor RNA is designated SEQ ID:782, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:782 is located at position 85864 relative to the genome of shrimp white spot syndrome virus (white spot bacilliform virus).

[11101] VGAM796 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM796 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11102] An enzyme complex designated DICER COMPLEX, dices the VGAM796 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM796 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM796 RNA is designated SEQ ID:3507, and

is provided hereinbelow with reference to the sequence listing part.

[11103] VGAM796 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM796 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM796 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11104] VGAM796 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM796 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM796 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM796 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM796 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11105] The complementary binding of VGAM796 RNA, herein designated VGAM RNA, to host target binding sites on VGAM796 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM796 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM796 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11106] It is appreciated that VGAM796 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM796 host target genes. The mRNA of each one of this plurality of VGAM796 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM796 RNA, herein designated VGAM RNA, and which when bound by VGAM796 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM796 host target proteins.

[11107] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM796 gene, herein designated VGAM GENE, on one or more VGAM796 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11108] It is yet further appreciated that a function of VGAM796 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM796 include diagnosis, prevention and treatment of viral infection by shrimp white spot syndrome virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM796 correlate with, and may be deduced from, the identity of the host target genes which VGAM796 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11109] Nucleotide sequences of the VGAM796 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM796 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM796 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM796 are further described hereinbelow with reference to Table 1.

[11110] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM796 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[11111] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 797 (VGAM797) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11112] VGAM797 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM797 was detected is described hereinabove with reference to Figs. 2–8.

[11113] VGAM797 gene, herein designated VGAM GENE, is a viral gene contained in the genome of shrimp white spot syndrome virus (white spot bacilliform virus). VGAM797 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11114] VGAM797 gene, herein designated VGAM GENE, encodes a VGAM797 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM797 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM797 precursor RNA is designated SEQ ID:783, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:783 is located at position 100499 relative to the genome of shrimp white spot syndrome virus (white spot bacilliform virus).

[11115] VGAM797 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM797 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11116] An enzyme complex designated DICER COMPLEX, dices the VGAM797 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM797 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM797 RNA is designated SEQ ID:3508, and is provided hereinbelow with reference to the sequence listing part.

[11117] VGAM797 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM797 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM797 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11118] VGAM797 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM797 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM797 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM797 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM797 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11119] The complementary binding of VGAM797 RNA, herein designated VGAM RNA, to host target binding sites on VGAM797 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM797 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM797 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11120] It is appreciated that VGAM797 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM797 host target genes. The mRNA of each one of this plurality of VGAM797 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM797 RNA, herein designated VGAM RNA, and which when bound by VGAM797 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM797 host target proteins.

[11121] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM797 gene, herein designated VGAM GENE, on one or more VGAM797 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11122] It is yet further appreciated that a function of VGAM797 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM797 include diagnosis, prevention and treatment of viral infection by shrimp white spot syndrome virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM797 correlate with, and may be deduced from, the identity of the host target genes which VGAM797 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11123] Nucleotide sequences of the VGAM797 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM797 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM797 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM797 are further described hereinbelow with reference to Table 1.

[11124] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM797 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11125] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 798 (VGAM798) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11126] VGAM798 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM798 was detected is described hereinabove with reference to Figs. 2–8.

[11127] VGAM798 gene, herein designated VGAM GENE, is a viral gene contained in the genome of shrimp white spot syndrome virus (white spot bacilliform virus). VGAM798 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11128] VGAM798 gene, herein designated VGAM GENE, encodes a VGAM798 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM798 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM798 precursor RNA is designated SEQ ID:784, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:784 is located at position 102198 relative to the genome of shrimp white spot syndrome virus (white spot bacilliform virus).

[11129] VGAM798 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM798 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11130] An enzyme complex designated DICER COMPLEX, dices the VGAM798 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM798 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM798 RNA is designated SEQ ID:3509, and is provided hereinbelow with reference to the sequence listing part.

[11131] VGAM798 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM798 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM798 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11132] VGAM798 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM798 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM798 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM798 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM798 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11133] The complementary binding of VGAM798 RNA, herein designated VGAM RNA, to host target binding sites on VGAM798 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM798 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM798 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11134] It is appreciated that VGAM798 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM798 host target genes. The mRNA of each one of this plurality of VGAM798 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM798 RNA, herein designated VGAM RNA, and which when bound by VGAM798 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM798 host target proteins.

[11135] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM798 gene, herein designated VGAM GENE, on one or more VGAM798 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11136] It is yet further appreciated that a function of VGAM798 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM798 include diagnosis, prevention and treatment of viral infection by shrimp white spot syndrome virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM798 correlate with, and may be deduced from, the identity of the host target genes which VGAM798 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11137] Nucleotide sequences of the VGAM798 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM798 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM798 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM798 are further de-

scribed hereinbelow with reference to Table 1.

[11138] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM798 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11139] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 799 (VGAM799) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11140] VGAM799 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM799 was detected is described hereinabove with reference to Figs. 2-8.

[11141] VGAM799 gene, herein designated VGAM GENE, is a viral gene contained in the genome of shrimp white spot syndrome virus (white spot bacilliform virus). VGAM799 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11142] VGAM799 gene, herein designated VGAM GENE, encodes a VGAM799 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM799 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM799 precursor RNA is designated SEQ ID:785, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:785 is located at position 181145 relative to the genome of shrimp white spot syndrome virus (white spot bacilliform virus).

[11143] VGAM799 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM799 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11144] An enzyme complex designated DICER COMPLEX, dices

the VGAM799 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM799 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM799 RNA is designated SEQ ID:3510, and is provided hereinbelow with reference to the sequence listing part.

[11145] VGAM799 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM799 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM799 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11146] VGAM799 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM799 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM799 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM799 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM799 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11147] The complementary binding of VGAM799 RNA, herein designated VGAM RNA, to host target binding sites on VGAM799 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM799 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM799 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11148] It is appreciated that VGAM799 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM799 host target genes. The mRNA of each one of this plurality of VGAM799 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM799 RNA, herein designated VGAM RNA, and which when bound by VGAM799 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM799 host target proteins.

[11149] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM799 gene, herein designated VGAM GENE, on one or more VGAM799 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11150] It is yet further appreciated that a function of VGAM799 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM799 include diagnosis, prevention and treatment of viral infection by shrimp white spot syndrome virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM799 correlate with, and may be deduced from, the identity of the host target genes which VGAM799 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11151] Nucleotide sequences of the VGAM799 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM799 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM799 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM799 are further described hereinbelow with reference to Table 1.

[11152] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM799 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11153] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 800 (VGAM800) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11154] VGAM800 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM800 was detected is described hereinabove with reference to Figs. 2-8.

[11155] VGAM800 gene, herein designated VGAM GENE, is a viral gene contained in the genome of shrimp white spot syn-

drome virus (white spot bacilliform virus). VGAM800 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11156] VGAM800 gene, herein designated VGAM GENE, encodes a VGAM800 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM800 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM800 precursor RNA is designated SEQ ID:786, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:786 is located at position 181601 relative to the genome of shrimp white spot syndrome virus (white spot bacilliform virus).

[11157] VGAM800 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM800 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11158] An enzyme complex designated DICER COMPLEX, dices the VGAM800 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM800 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM800 RNA is designated SEQ ID:3511, and is provided hereinbelow with reference to the sequence listing part.

[11159] VGAM800 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM800 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM800 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11160] VGAM800 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM800 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM800 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM800 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM800 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11161] The complementary binding of VGAM800 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM800 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM800 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM800 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11162] It is appreciated that VGAM800 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM800 host target genes. The mRNA of each one of this plurality of VGAM800 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM800 RNA, herein designated VGAM RNA, and which when bound by VGAM800 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM800 host target proteins.

[11163] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM800 gene, herein designated VGAM GENE, on one or more VGAM800 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11164] It is yet further appreciated that a function of VGAM800 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM800 include diagnosis, prevention and treatment of viral infection by shrimp white spot syndrome virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM800 correlate with, and may be deduced from, the identity of the host target genes which VGAM800 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11165] Nucleotide sequences of the VGAM800 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM800 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM800 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM800 are further described hereinbelow with reference to Table 1.

[11166] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM800 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11167] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 801 (VGAM801) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11168] VGAM801 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM801 was detected is described

hereinabove with reference to Figs. 2–8.

[11169] VGAM801 gene, herein designated VGAM GENE, is a viral gene contained in the genome of murid herpesvirus 4.

VGAM801 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11170] VGAM801 gene, herein designated VGAM GENE, encodes a VGAM801 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM801 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM801 precursor RNA is designated SEQ ID:787, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:787 is located at position 962 relative to the genome of murid herpesvirus 4.

[11171] VGAM801 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM801 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11172] An enzyme complex designated DICER COMPLEX, dices the VGAM801 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM801 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM801 RNA is designated SEQ ID:3512, and is provided hereinbelow with reference to the sequence listing part.

[11173] VGAM801 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM801 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM801 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11174] VGAM801 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM801 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM801 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM801 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM801 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[11175] The complementary binding of VGAM801 RNA, herein designated VGAM RNA, to host target binding sites on VGAM801 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM801 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM801 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11176] It is appreciated that VGAM801 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM801 host target genes. The mRNA of each one of this plurality of VGAM801 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM801 RNA, herein designated VGAM RNA, and which when bound by VGAM801 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM801 host target proteins.

[11177] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM801 gene, herein designated VGAM GENE, on one or more VGAM801 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11178] It is yet further appreciated that a function of VGAM801 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM801 include diagnosis, prevention and treatment of viral infection by murid herpesvirus 4. Specific functions, and accordingly utilities, of VGAM801 correlate with, and may be deduced from, the identity of the host target genes which VGAM801 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[11179] Nucleotide sequences of the VGAM801 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM801 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM801 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM801 are further described hereinbelow with reference to Table 1.

[11180] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM801 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11181] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 802 (VGAM802) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11182] VGAM802 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM802 was detected is described hereinabove with reference to Figs. 2–8.

[11183] VGAM802 gene, herein designated VGAM GENE, is a viral gene contained in the genome of murid herpesvirus 4.

VGAM802 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11184] VGAM802 gene, herein designated VGAM GENE, encodes a VGAM802 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM802 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM802 precursor RNA is designated SEQ ID:788, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:788 is located at position 638 relative to the genome of murid herpesvirus 4.

[11185] VGAM802 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM802 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11186] An enzyme complex designated DICER COMPLEX, dices the VGAM802 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM802 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of VGAM802 RNA is designated SEQ ID:3513, and is provided hereinbelow with reference to the sequence listing part.

[11187] VGAM802 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM802 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM802 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11188] VGAM802 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM802 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM802 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM802 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM802 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11189] The complementary binding of VGAM802 RNA, herein designated VGAM RNA, to host target binding sites on VGAM802 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM802 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM802 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11190] It is appreciated that VGAM802 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM802 host target genes. The mRNA of each one of this plurality of VGAM802 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM802 RNA, herein designated VGAM RNA, and which when bound by VGAM802 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM802 host target proteins.

[11191] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM802 gene, herein designated VGAM GENE, on one or more VGAM802 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11192] It is yet further appreciated that a function of VGAM802 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM802 include diagnosis, prevention and treatment of viral infection by murid herpesvirus 4. Specific functions, and accordingly utilities, of VGAM802 correlate with, and may be deduced from, the identity of the host target genes which VGAM802 binds and inhibits, and

the function of these host target genes, as elaborated hereinbelow.

[11193] Nucleotide sequences of the VGAM802 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM802 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM802 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM802 are further described hereinbelow with reference to Table 1.

[11194] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM802 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11195] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 803 (VGAM803) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11196] VGAM803 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM803 was detected is described hereinabove with reference to Figs. 2–8.

[11197] VGAM803 gene, herein designated VGAM GENE, is a viral gene contained in the genome of murid herpesvirus 4. VGAM803 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11198] VGAM803 gene, herein designated VGAM GENE, encodes a VGAM803 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM803 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM803 precursor RNA is designated SEQ ID:789, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:789 is located at position 201 relative to the genome of murid herpesvirus 4.

[11199] VGAM803 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM803 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11200] An enzyme complex designated DICER COMPLEX, dices the VGAM803 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM803 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM803 RNA is designated SEQ ID:3514, and is provided hereinbelow with reference to the sequence listing part.

[11201] VGAM803 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM803 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM803 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11202] VGAM803 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM803 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM803 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM803 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM803 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11203] The complementary binding of VGAM803 RNA, herein designated VGAM RNA, to host target binding sites on VGAM803 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM803 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM803 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11204] It is appreciated that VGAM803 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM803 host target genes. The mRNA of each one of this plurality of VGAM803 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM803 RNA, herein designated VGAM RNA, and which when bound by VGAM803 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM803 host target proteins.

[11205] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM803 gene, herein designated VGAM GENE, on one or more VGAM803 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11206] It is yet further appreciated that a function of VGAM803 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM803 include diagnosis, prevention and treatment of viral infection by murid herpesvirus 4. Specific functions, and accordingly utilities, of VGAM803 correlate with, and may be deduced from, the identity of the

host target genes which VGAM803 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11207] Nucleotide sequences of the VGAM803 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM803 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM803 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM803 are further described hereinbelow with reference to Table 1.

[11208] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM803 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11209] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 804 (VGAM804) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11210] VGAM804 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM804 was detected is described hereinabove with reference to Figs. 2–8.

[11211] VGAM804 gene, herein designated VGAM GENE, is a viral gene contained in the genome of shrimp white spot syndrome virus (white spot bacilliform virus). VGAM804 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11212] VGAM804 gene, herein designated VGAM GENE, encodes a VGAM804 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM804 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM804 precursor RNA is designated SEQ ID:790, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:790 is located at position 229000 relative to the genome of shrimp white spot syndrome virus (white spot bacilliform virus).

[11213] VGAM804 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM804 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11214] An enzyme complex designated DICER COMPLEX, dices the VGAM804 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM804 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM804 RNA is designated SEQ ID:3515, and is provided hereinbelow with reference to the sequence listing part.

[11215] VGAM804 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM804 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM804 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11216] VGAM804 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM804 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM804 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM804 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM804 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11217] The complementary binding of VGAM804 RNA, herein designated VGAM RNA, to host target binding sites on VGAM804 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM804 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM804 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11218] It is appreciated that VGAM804 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM804 host target genes. The mRNA of each one of this plurality of VGAM804 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM804 RNA, herein designated VGAM RNA, and which when bound by VGAM804 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM804 host target proteins.

[11219] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM804 gene, herein designated VGAM GENE, on one or more VGAM804 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11220] It is yet further appreciated that a function of VGAM804 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM804 include diagnosis, prevention and treatment of viral infection by shrimp white spot syn-

drome virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM804 correlate with, and may be deduced from, the identity of the host target genes which VGAM804 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11221] Nucleotide sequences of the VGAM804 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM804 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM804 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM804 are further described hereinbelow with reference to Table 1.

[11222] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM804 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11223] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 805 (VGAM805) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11224] VGAM805 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM805 was detected is described hereinabove with reference to Figs. 2–8.

[11225] VGAM805 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Feline immunodeficiency virus. VGAM805 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11226] VGAM805 gene, herein designated VGAM GENE, encodes a VGAM805 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM805 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM805 precursor RNA is designated SEQ ID:791, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:791 is located at position 8793 relative to the genome of Feline immunodeficiency virus.

[11227] VGAM805 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM805 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11228] An enzyme complex designated DICER COMPLEX, dices the VGAM805 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM805 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM805 RNA is designated SEQ ID:3516, and is provided hereinbelow with reference to the sequence listing part.

[11229] VGAM805 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM805 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM805 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11230] VGAM805 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM805 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM805 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM805 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM805 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11231] The complementary binding of VGAM805 RNA, herein designated VGAM RNA, to host target binding sites on VGAM805 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM805 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM805 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11232] It is appreciated that VGAM805 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM805 host target genes. The mRNA of each one of this plurality of VGAM805 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM805 RNA, herein designated VGAM RNA, and which when bound by VGAM805 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM805 host target proteins.

[11233] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM805 gene, herein designated VGAM GENE, on one or more VGAM805 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11234] It is yet further appreciated that a function of VGAM805 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM805 include diagnosis, prevention and treatment of viral infection by Feline immunodeficiency virus. Specific functions, and accordingly utilities, of VGAM805 correlate with, and may be deduced from, the identity of the host target genes which VGAM805 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11235] Nucleotide sequences of the VGAM805 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM805 RNA, herein designated VGAM RNA, and a

schematic representation of the secondary folding of VGAM805 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM805 are further described hereinbelow with reference to Table 1.

[11236] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM805 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11237] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 806 (VGAM806) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11238] VGAM806 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM806 was detected is described hereinabove with reference to Figs. 2-8.

[11239] VGAM806 gene, herein designated VGAM GENE, is a viral gene contained in the genome of shrimp white spot syn-

drome virus (white spot bacilliform virus). VGAM806 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11240] VGAM806 gene, herein designated VGAM GENE, encodes a VGAM806 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM806 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM806 precursor RNA is designated SEQ ID:792, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:792 is located at position 250093 relative to the genome of shrimp white spot syndrome virus (white spot bacilliform virus).

[11241] VGAM806 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM806 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11242] An enzyme complex designated DICER COMPLEX, dices the VGAM806 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM806 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM806 RNA is designated SEQ ID:3517, and is provided hereinbelow with reference to the sequence listing part.

[11243] VGAM806 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM806 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM806 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11244] VGAM806 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM806 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM806 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM806 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM806 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11245] The complementary binding of VGAM806 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM806 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM806 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM806 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11246] It is appreciated that VGAM806 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM806 host target genes. The mRNA of each one of this plurality of VGAM806 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM806 RNA, herein designated VGAM RNA, and which when bound by VGAM806 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM806 host target proteins.

[11247] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM806 gene, herein designated VGAM GENE, on one or more VGAM806 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11248] It is yet further appreciated that a function of VGAM806 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM806 include diagnosis, prevention and treatment of viral infection by shrimp white spot syndrome virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM806 correlate with, and may be deduced from, the identity of the host target genes which VGAM806 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11249] Nucleotide sequences of the VGAM806 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM806 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM806 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM806 are further described hereinbelow with reference to Table 1.

[11250] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM806 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11251] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 807 (VGAM807) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11252] VGAM807 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM807 was detected is described

hereinabove with reference to Figs. 2–8.

[11253] VGAM807 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM807 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11254] VGAM807 gene, herein designated VGAM GENE, encodes a VGAM807 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM807 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM807 precursor RNA is designated SEQ ID:793, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:793 is located at position 61419 relative to the genome of Equine herpesvirus 2.

[11255] VGAM807 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM807 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11256] An enzyme complex designated DICER COMPLEX, dices the VGAM807 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM807 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM807 RNA is designated SEQ ID:3518, and is provided hereinbelow with reference to the sequence listing part.

[11257] VGAM807 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM807 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM807 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 un-

translated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11258] VGAM807 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM807 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM807 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM807 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM807 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[11259] The complementary binding of VGAM807 RNA, herein designated VGAM RNA, to host target binding sites on VGAM807 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM807 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM807 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11260] It is appreciated that VGAM807 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM807 host target genes. The mRNA of each one of this plurality of VGAM807 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM807 RNA, herein designated VGAM RNA, and which when bound by VGAM807 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM807 host target proteins.

[11261] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM807 gene, herein designated VGAM GENE, on one or more VGAM807 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11262] It is yet further appreciated that a function of VGAM807 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM807 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM807 correlate with, and may be deduced from, the identity of the host target genes which VGAM807 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[11263] Nucleotide sequences of the VGAM807 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM807 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM807 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM807 are further described hereinbelow with reference to Table 1.

[11264] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM807 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11265] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 808 (VGAM808) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11266] VGAM808 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM808 was detected is described hereinabove with reference to Figs. 2–8.

[11267] VGAM808 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM808 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11268] VGAM808 gene, herein designated VGAM GENE, encodes a VGAM808 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM808 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM808 precursor RNA is designated SEQ ID:794, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:794 is located at position 60546 relative to the genome of Equine herpesvirus 2.

[11269] VGAM808 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM808 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11270] An enzyme complex designated DICER COMPLEX, dices the VGAM808 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM808 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM808 RNA is designated SEQ ID:3519, and is provided hereinbelow with reference to the sequence listing part.

[11271] VGAM808 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM808 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM808 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5

untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11272] VGAM808 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM808 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM808 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM808 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM808 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11273] The complementary binding of VGAM808 RNA, herein designated VGAM RNA, to host target binding sites on VGAM808 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM808 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM808 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11274] It is appreciated that VGAM808 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM808 host target genes. The mRNA of each one of this plurality of VGAM808 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM808 RNA, herein designated VGAM RNA, and which when bound by VGAM808 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM808 host target proteins.

[11275] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM808 gene, herein designated VGAM GENE, on one or more VGAM808 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11276] It is yet further appreciated that a function of VGAM808 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM808 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM808 correlate with, and may be deduced from, the identity of the host target genes which VGAM808 binds and inhibits, and

the function of these host target genes, as elaborated hereinbelow.

[11277] Nucleotide sequences of the VGAM808 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM808 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM808 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM808 are further described hereinbelow with reference to Table 1.

[11278] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM808 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11279] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 809 (VGAM809) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11280] VGAM809 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM809 was detected is described hereinabove with reference to Figs. 2–8.

[11281] VGAM809 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM809 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11282] VGAM809 gene, herein designated VGAM GENE, encodes a VGAM809 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM809 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM809 precursor RNA is designated SEQ ID:795, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:795 is located at position 60052 relative to the genome of Equine herpesvirus 2.

[11283] VGAM809 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM809 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11284] An enzyme complex designated DICER COMPLEX, dices the VGAM809 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM809 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM809 RNA is designated SEQ ID:3520, and is provided hereinbelow with reference to the sequence listing part.

[11285] VGAM809 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM809 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM809 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three re-

gions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11286] VGAM809 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM809 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM809 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM809 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM809 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11287] The complementary binding of VGAM809 RNA, herein designated VGAM RNA, to host target binding sites on VGAM809 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM809 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM809 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11288] It is appreciated that VGAM809 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM809 host target genes. The mRNA of each one of this plurality of VGAM809 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM809 RNA, herein designated VGAM RNA, and which when bound by VGAM809 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM809 host target proteins.

[11289] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM809 gene, herein designated VGAM GENE, on one or more VGAM809 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11290] It is yet further appreciated that a function of VGAM809 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM809 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM809 correlate with, and may be deduced from, the identity of the

host target genes which VGAM809 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11291] Nucleotide sequences of the VGAM809 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM809 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM809 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM809 are further described hereinbelow with reference to Table 1.

[11292] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM809 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11293] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 810 (VGAM810) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11294] VGAM810 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM810 was detected is described hereinabove with reference to Figs. 2–8.

[11295] VGAM810 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta moorei entomopoxvirus. VGAM810 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11296] VGAM810 gene, herein designated VGAM GENE, encodes a VGAM810 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM810 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM810 precursor RNA is designated SEQ ID:796, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:796 is located at position 84714 relative to the genome of Amsacta moorei entomopoxvirus.

[11297] VGAM810 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM810 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11298] An enzyme complex designated DICER COMPLEX, dices the VGAM810 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM810 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM810 RNA is designated SEQ ID:3521, and is provided hereinbelow with reference to the sequence listing part.

[11299] VGAM810 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM810 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM810 host target RNA, herein

designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11300] VGAM810 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM810 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM810 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM810 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM810 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11301] The complementary binding of VGAM810 RNA, herein designated VGAM RNA, to host target binding sites on VGAM810 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM810 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM810 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11302] It is appreciated that VGAM810 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM810 host target genes. The mRNA of each one of this plurality of VGAM810 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM810 RNA, herein designated VGAM RNA, and which when bound by VGAM810 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM810 host target proteins.

[11303] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM810 gene, herein designated VGAM GENE, on one or more VGAM810 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11304] It is yet further appreciated that a function of VGAM810 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM810 include diagnosis, prevention and treatment of viral infection by Amsacta moorei entomopoxvirus. Specific functions, and accordingly utilities,

of VGAM810 correlate with, and may be deduced from, the identity of the host target genes which VGAM810 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11305] Nucleotide sequences of the VGAM810 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM810 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM810 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM810 are further described hereinbelow with reference to Table 1.

[11306] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM810 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11307] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 811 (VGAM811) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[11308] VGAM811 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM811 was detected is described hereinabove with reference to Figs. 2–8.

[11309] VGAM811 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM811 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11310] VGAM811 gene, herein designated VGAM GENE, encodes a VGAM811 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM811 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM811 precursor RNA is designated SEQ ID:797, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:797 is located at position 161607 relative to the genome of Melanoplus sanguinipes entomopoxvirus.

[11311] VGAM811 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM811 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11312] An enzyme complex designated DICER COMPLEX, dices the VGAM811 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM811 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM811 RNA is designated SEQ ID:3522, and is provided hereinbelow with reference to the sequence listing part.

[11313] VGAM811 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM811 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM811 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11314] VGAM811 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM811 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM811 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM811 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM811 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11315] The complementary binding of VGAM811 RNA, herein designated VGAM RNA, to host target binding sites on VGAM811 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM811 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM811 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11316] It is appreciated that VGAM811 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM811 host target genes. The mRNA of each one of this plurality of VGAM811 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM811 RNA, herein designated VGAM RNA, and which when bound by VGAM811 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM811 host target proteins.

[11317] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM811 gene, herein designated VGAM GENE, on one or more VGAM811 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11318] It is yet further appreciated that a function of VGAM811 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM811 include diagnosis, prevention and

treatment of viral infection by *Melanoplus sanguinipes* entomopoxvirus. Specific functions, and accordingly utilities, of VGAM811 correlate with, and may be deduced from, the identity of the host target genes which VGAM811 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11319] Nucleotide sequences of the VGAM811 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM811 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM811 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM811 are further described hereinbelow with reference to Table 1.

[11320] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM811 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11321] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 812 (VGAM812) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11322] VGAM812 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM812 was detected is described hereinabove with reference to Figs. 2–8.

[11323] VGAM812 gene, herein designated VGAM GENE, is a viral gene contained in the genome of murid herpesvirus 4. VGAM812 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11324] VGAM812 gene, herein designated VGAM GENE, encodes a VGAM812 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM812 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM812 precursor RNA is designated SEQ ID:798, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:798 is located at position 60284 relative to the genome of murid herpesvirus 4.

[11325] VGAM812 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM812 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11326] An enzyme complex designated DICER COMPLEX, dices the VGAM812 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM812 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM812 RNA is designated SEQ ID:3523, and is provided hereinbelow with reference to the sequence listing part.

[11327] VGAM812 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM812 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM812 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11328] VGAM812 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM812 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM812 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM812 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM812 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11329] The complementary binding of VGAM812 RNA, herein designated VGAM RNA, to host target binding sites on VGAM812 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM812 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM812 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11330] It is appreciated that VGAM812 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM812 host target genes. The mRNA of each one of this plurality of VGAM812 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM812 RNA, herein designated VGAM

RNA, and which when bound by VGAM812 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM812 host target proteins.

[11331] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM812 gene, herein designated VGAM GENE, on one or more VGAM812 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11332] It is yet further appreciated that a function of VGAM812 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM812 include diagnosis, prevention and treatment of viral infection by murid herpesvirus 4. Specific functions, and accordingly utilities, of VGAM812 correlate with, and may be deduced from, the identity of the host target genes which VGAM812 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11333] Nucleotide sequences of the VGAM812 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM812 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM812 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM812 are further described hereinbelow with reference to Table 1.

[11334] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM812 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11335] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 813 (VGAM813) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11336] VGAM813 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM813 was detected is described hereinabove with reference to Figs. 2–8.

[11337] VGAM813 gene, herein designated VGAM GENE, is a viral gene contained in the genome of murid herpesvirus 4. VGAM813 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11338] VGAM813 gene, herein designated VGAM GENE, encodes a VGAM813 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM813 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM813 precursor RNA is designated SEQ ID:799, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:799 is located at position 61060 relative to

the genome of murid herpesvirus 4.

[11339] VGAM813 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM813 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11340] An enzyme complex designated DICER COMPLEX, dices the VGAM813 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM813 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM813 RNA is designated SEQ ID:3524, and is provided hereinbelow with reference to the sequence listing part.

[11341] VGAM813 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM813 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM813 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11342] VGAM813 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM813 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM813 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM813 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM813 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11343] The complementary binding of VGAM813 RNA, herein designated VGAM RNA, to host target binding sites on VGAM813 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM813 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM813 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11344] It is appreciated that VGAM813 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM813 host target genes. The mRNA of each one of this plurality of VGAM813 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM813 RNA, herein designated VGAM RNA, and which when bound by VGAM813 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM813 host target proteins.

[11345] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM813 gene, herein designated VGAM GENE, on one or more VGAM813 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11346] It is yet further appreciated that a function of VGAM813 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM813 include diagnosis, prevention and treatment of viral infection by murid herpesvirus 4. Specific functions, and accordingly utilities, of VGAM813 correlate with, and may be deduced from, the identity of the host target genes which VGAM813 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11347] Nucleotide sequences of the VGAM813 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM813 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM813 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM813 are further described hereinbelow with reference to Table 1.

[11348] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM813 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11349] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 814 (VGAM814) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11350] VGAM814 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM814 was detected is described hereinabove with reference to Figs. 2–8.

[11351] VGAM814 gene, herein designated VGAM GENE, is a viral gene contained in the genome of murid herpesvirus 4. VGAM814 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11352] VGAM814 gene, herein designated VGAM GENE, encodes a VGAM814 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM814 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM814 precursor RNA is designated SEQ ID:800, and is provided hereinbelow with reference to the sequence listing part. Nucleotide se–

quence SEQ ID:800 is located at position 58920 relative to the genome of murid herpesvirus 4.

[11353] VGAM814 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM814 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11354] An enzyme complex designated DICER COMPLEX, dices the VGAM814 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM814 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM814 RNA is designated SEQ ID:3525, and is provided hereinbelow with reference to the sequence

listing part.

[11355] VGAM814 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM814 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM814 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11356] VGAM814 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM814 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM814 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM814 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM814 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11357] The complementary binding of VGAM814 RNA, herein designated VGAM RNA, to host target binding sites on VGAM814 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM814 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM814 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11358] It is appreciated that VGAM814 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM814 host target genes. The mRNA of each one of this plurality of VGAM814 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM814 RNA, herein designated VGAM RNA, and which when bound by VGAM814 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM814 host target proteins.

[11359] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM814 gene, herein designated VGAM GENE, on one or more VGAM814 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11360] It is yet further appreciated that a function of VGAM814 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM814 include diagnosis, prevention and treatment of viral infection by murid herpesvirus 4. Specific functions, and accordingly utilities, of VGAM814 correlate with, and may be deduced from, the identity of the host target genes which VGAM814 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11361] Nucleotide sequences of the VGAM814 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM814 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM814 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM814 are further described hereinbelow with reference to Table 1.

[11362] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM814 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11363] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 815 (VGAM815) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11364] VGAM815 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM815 was detected is described hereinabove with reference to Figs. 2–8.

[11365] VGAM815 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM815 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11366] VGAM815 gene, herein designated VGAM GENE, encodes a VGAM815 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM815 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM815 precursor RNA is designated SEQ ID:801, and is provided hereinbelow with

reference to the sequence listing part. Nucleotide sequence SEQ ID:801 is located at position 59708 relative to the genome of *Macaca mulatta* rhadinovirus.

[11367] VGAM815 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM815 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11368] An enzyme complex designated DICER COMPLEX, dices the VGAM815 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM815 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM815 RNA is designated SEQ ID:3526, and

is provided hereinbelow with reference to the sequence listing part.

[11369] VGAM815 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM815 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM815 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11370] VGAM815 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM815 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM815 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM815 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM815 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11371] The complementary binding of VGAM815 RNA, herein designated VGAM RNA, to host target binding sites on VGAM815 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM815 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM815 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11372] It is appreciated that VGAM815 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM815 host target genes. The mRNA of each one of this plurality of VGAM815 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM815 RNA, herein designated VGAM RNA, and which when bound by VGAM815 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM815 host target proteins.

[11373] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM815 gene, herein designated VGAM GENE, on one or more VGAM815 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11374] It is yet further appreciated that a function of VGAM815 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM815 include diagnosis, prevention and treatment of viral infection by *Macaca mulatta* rhadinovirus. Specific functions, and accordingly utilities, of VGAM815 correlate with, and may be deduced from, the identity of the host target genes which VGAM815 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11375] Nucleotide sequences of the VGAM815 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM815 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM815 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM815 are further described hereinbelow with reference to Table 1.

[11376] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM815 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11377] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 816 (VGAM816) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11378] VGAM816 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM816 was detected is described hereinabove with reference to Figs. 2–8.

[11379] VGAM816 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Macaca mulatta* rhadinovirus. VGAM816 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11380] VGAM816 gene, herein designated VGAM GENE, encodes a VGAM816 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM816 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM816 precursor RNA is

designated SEQ ID:802, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:802 is located at position 60360 relative to the genome of *Macaca mulatta* rhadinovirus.

[11381] VGAM816 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM816 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11382] An enzyme complex designated DICER COMPLEX, dices the VGAM816 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM816 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide se-

quence of VGAM816 RNA is designated SEQ ID:3527, and is provided hereinbelow with reference to the sequence listing part.

[11383] VGAM816 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM816 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM816 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11384] VGAM816 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM816 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM816 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM816 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM816 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11385] The complementary binding of VGAM816 RNA, herein designated VGAM RNA, to host target binding sites on VGAM816 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM816 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM816 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11386] It is appreciated that VGAM816 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM816 host target genes. The mRNA of

each one of this plurality of VGAM816 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM816 RNA, herein designated VGAM RNA, and which when bound by VGAM816 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM816 host target proteins.

[11387] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM816 gene, herein designated VGAM GENE, on one or more VGAM816 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[11388] It is yet further appreciated that a function of VGAM816 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM816 include diagnosis, prevention and treatment of viral infection by *Macaca mulatta* rhadinovirus. Specific functions, and accordingly utilities, of VGAM816 correlate with, and may be deduced from, the identity of the host target genes which VGAM816 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11389] Nucleotide sequences of the VGAM816 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM816 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM816 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM816 are further described hereinbelow with reference to Table 1.

[11390] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM816 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[11391] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 817 (VGAM817) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11392] VGAM817 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM817 was detected is described hereinabove with reference to Figs. 2–8.

[11393] VGAM817 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM817 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11394] VGAM817 gene, herein designated VGAM GENE, encodes a VGAM817 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM817 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar

to the nucleotide sequence of VGAM817 precursor RNA is designated SEQ ID:803, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:803 is located at position 19278 relative to the genome of Monkeypox virus.

[11395] VGAM817 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM817 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11396] An enzyme complex designated DICER COMPLEX, dices the VGAM817 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM817 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 75%) nucleotide sequence of VGAM817 RNA is designated SEQ ID:3528, and is provided hereinbelow with reference to the sequence listing part.

[11397] VGAM817 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM817 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM817 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11398] VGAM817 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM817 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM817 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM817 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM817 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11399] The complementary binding of VGAM817 RNA, herein designated VGAM RNA, to host target binding sites on VGAM817 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM817 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM817 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11400] It is appreciated that VGAM817 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM817 host target genes. The mRNA of each one of this plurality of VGAM817 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM817 RNA, herein designated VGAM RNA, and which when bound by VGAM817 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM817 host target proteins.

[11401] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM817 gene, herein designated VGAM GENE, on one or more VGAM817 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science
294,779 (2001)).

[11402] It is yet further appreciated that a function of VGAM817 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM817 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM817 correlate with, and may be deduced from, the identity of the host target genes which VGAM817 binds and inhibits, and the function of these host target genes, as elaborated herein—below.

[11403] Nucleotide sequences of the VGAM817 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM817 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM817 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM817 are further described hereinbelow with reference to Table 1.

[11404] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM817 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11405] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 818 (VGAM818) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11406] VGAM818 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM818 was detected is described hereinabove with reference to Figs. 2–8.

[11407] VGAM818 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM818 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11408] VGAM818 gene, herein designated VGAM GENE, encodes a VGAM818 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM818 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a

protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM818 precursor RNA is designated SEQ ID:804, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:804 is located at position 27338 relative to the genome of Monkeypox virus.

[11409] VGAM818 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM818 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11410] An enzyme complex designated DICER COMPLEX, dices the VGAM818 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM818 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM818 RNA is designated SEQ ID:3529, and is provided hereinbelow with reference to the sequence listing part.

[11411] VGAM818 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM818 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM818 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11412] VGAM818 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM818 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM818 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM818 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM818 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11413] The complementary binding of VGAM818 RNA, herein designated VGAM RNA, to host target binding sites on VGAM818 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM818 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM818 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11414] It is appreciated that VGAM818 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM818 host target genes. The mRNA of each one of this plurality of VGAM818 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM818 RNA, herein designated VGAM RNA, and which when bound by VGAM818 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM818 host target proteins.

[11415] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM818 gene, herein designated VGAM GENE, on one or more VGAM818 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11416] It is yet further appreciated that a function of VGAM818 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM818 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM818 correlate with, and may be deduced from, the identity of the host target genes which VGAM818 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11417] Nucleotide sequences of the VGAM818 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM818 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM818 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM818 are further described hereinbelow with reference to Table 1.

[11418] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM818 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11419] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 819 (VGAM819) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11420] VGAM819 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM819 was detected is described hereinabove with reference to Figs. 2–8.

[11421] VGAM819 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM819 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11422] VGAM819 gene, herein designated VGAM GENE, encodes a VGAM819 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM819 precursor RNA, herein

designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM819 precursor RNA is designated SEQ ID:805, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:805 is located at position 92255 relative to the genome of Ateline herpesvirus 3.

[11423] VGAM819 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM819 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11424] An enzyme complex designated DICER COMPLEX, dices the VGAM819 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM819 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM819 RNA is designated SEQ ID:3530, and is provided hereinbelow with reference to the sequence listing part.

[11425] VGAM819 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM819 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM819 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11426] VGAM819 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM819 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM819 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM819 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM819 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11427] The complementary binding of VGAM819 RNA, herein designated VGAM RNA, to host target binding sites on VGAM819 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM819 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM819 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11428] It is appreciated that VGAM819 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM819 host target genes. The mRNA of each one of this plurality of VGAM819 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM819 RNA, herein designated VGAM RNA, and which when bound by VGAM819 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM819 host target proteins.

[11429] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM819 gene, herein designated VGAM GENE, on one or more VGAM819 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11430] It is yet further appreciated that a function of VGAM819 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM819 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM819 correlate with, and may be deduced from, the identity of the host target genes which VGAM819 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11431] Nucleotide sequences of the VGAM819 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM819 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM819 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM819 are further described hereinbelow with reference to Table 1.

[11432] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM819 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11433] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 820 (VGAM820) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11434] VGAM820 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM820 was detected is described hereinabove with reference to Figs. 2–8.

[11435] VGAM820 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine herpesvirus 2. VGAM820 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11436] VGAM820 gene, herein designated VGAM GENE, encodes a VGAM820 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike

most ordinary genes, VGAM820 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM820 precursor RNA is designated SEQ ID:806, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:806 is located at position 97653 relative to the genome of Saimiriine herpesvirus 2.

[11437] VGAM820 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM820 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11438] An enzyme complex designated DICER COMPLEX, dices the VGAM820 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM820 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM820 RNA is designated SEQ ID:3531, and is provided hereinbelow with reference to the sequence listing part.

[11439] VGAM820 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM820 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM820 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11440] VGAM820 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM820 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM820 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM820 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM820 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11441] The complementary binding of VGAM820 RNA, herein designated VGAM RNA, to host target binding sites on VGAM820 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM820 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM820 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein

is therefore outlined by a broken line.

[11442] It is appreciated that VGAM820 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM820 host target genes. The mRNA of each one of this plurality of VGAM820 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM820 RNA, herein designated VGAM RNA, and which when bound by VGAM820 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM820 host target proteins.

[11443] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM820 gene, herein designated VGAM GENE, on one or more VGAM820 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11444] It is yet further appreciated that a function of VGAM820 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM820 include diagnosis, prevention and treatment of viral infection by Saimiriine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM820 correlate with, and may be deduced from, the identity of the host target genes which VGAM820 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11445] Nucleotide sequences of the VGAM820 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM820 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM820 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM820 are further described hereinbelow with reference to Table 1.

[11446] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM820 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11447] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 821 (VGAM821) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11448] VGAM821 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM821 was detected is described hereinabove with reference to Figs. 2-8.

[11449] VGAM821 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6. VGAM821 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11450] VGAM821 gene, herein designated VGAM GENE, encodes a VGAM821 precursor RNA, herein designated VGAM PRE-

CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM821 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM821 precursor RNA is designated SEQ ID:807, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:807 is located at position 120037 relative to the genome of Human herpesvirus 6.

[11451] VGAM821 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM821 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11452] An enzyme complex designated DICER COMPLEX, dices the VGAM821 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM821 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM821 RNA is designated SEQ ID:3532, and is provided hereinbelow with reference to the sequence listing part.

[11453] VGAM821 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM821 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM821 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11454] VGAM821 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM821 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM821 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM821 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM821 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11455] The complementary binding of VGAM821 RNA, herein designated VGAM RNA, to host target binding sites on VGAM821 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM821 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM821 host target protein, herein designated

VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11456] It is appreciated that VGAM821 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM821 host target genes. The mRNA of each one of this plurality of VGAM821 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM821 RNA, herein designated VGAM RNA, and which when bound by VGAM821 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM821 host target proteins.

[11457] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM821 gene, herein designated VGAM GENE, on one or more VGAM821 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11458] It is yet further appreciated that a function of VGAM821 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM821 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6. Specific functions, and accordingly utilities, of VGAM821 correlate with, and may be deduced from, the identity of the host target genes which VGAM821 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11459] Nucleotide sequences of the VGAM821 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM821 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM821 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM821 are further described hereinbelow with reference to Table 1.

[11460] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM821 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11461] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 822 (VGAM822) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11462] VGAM822 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM822 was detected is described hereinabove with reference to Figs. 2-8.

[11463] VGAM822 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6. VGAM822 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11464] VGAM822 gene, herein designated VGAM GENE, encodes a

VGAM822 precursor RNA, herein designated VGAM PRE-CURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM822 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM822 precursor RNA is designated SEQ ID:808, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:808 is located at position 117925 relative to the genome of Human herpesvirus 6.

[11465] VGAM822 precursor RNA, herein designated VGAM PRE-CURSOR RNA, folds onto itself, forming VGAM822 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11466] An enzyme complex designated DICER COMPLEX, dices the VGAM822 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM822 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM822 RNA is designated SEQ ID:3533, and is provided hereinbelow with reference to the sequence listing part.

[11467] VGAM822 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM822 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM822 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11468] VGAM822 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM822 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM822 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM822 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM822 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[11469] The complementary binding of VGAM822 RNA, herein designated VGAM RNA, to host target binding sites on VGAM822 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM822 host target RNA, herein designated VGAM HOST TARGET RNA,

into VGAM822 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[11470] It is appreciated that VGAM822 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM822 host target genes. The mRNA of each one of this plurality of VGAM822 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM822 RNA, herein designated VGAM RNA, and which when bound by VGAM822 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM822 host target proteins.

[11471] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM822 gene, herein designated VGAM GENE, on one or more VGAM822 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[11472] It is yet further appreciated that a function of VGAM822 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM822 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6. Specific functions, and accordingly utilities, of VGAM822 correlate with, and may be deduced from, the identity of the host target genes which VGAM822 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[11473] Nucleotide sequences of the VGAM822 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM822 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM822 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM822 are further de-

scribed hereinbelow with reference to Table 1.

[11474] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM822 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[11475] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 823 (VGAM823) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[11476] VGAM823 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM823 was detected is described hereinabove with reference to Figs. 2-8.

[11477] VGAM823 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM823 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[11478] VGAM823 gene, herein designated VGAM GENE, encodes a VGAM823 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM823 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM823 precursor RNA is designated SEQ ID:809, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:809 is located at position 2329 relative to the genome of African swine fever virus.

[11479] VGAM823 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM823 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[11480] An enzyme complex designated DICER COMPLEX, dices the VGAM823 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM823 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM823 RNA is designated SEQ ID:3534, and is provided hereinbelow with reference to the sequence listing part.

[11481] VGAM823 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM823 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM823 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[11482] VGAM823 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM823 host target RNA, herein designated VGAM HOST TARGET RNA. This
